Some of the local hams were doing it this winter, and had fun with it. I'm
not sure if they were doing it on FM though. Best way to see if it works the
way you want is to give it a shot.

Why not?

You can turn off the error correction with packet (passall, etc.) and get much the same effect. Instead of resends, you get garbage characters.

There is more advanced packet stuff now (FlexNet) that automatically adjusts its own TNC parameters on a frame by frame basis (dynamic) so that interference and retries are not so much of a problem. In the absence of interference, the new stuff is much faster than old style packet, too. If FlexNet notices that you have a good, strong connection, it will send 7 packet frames of 256 PACLEN every time your radio keys up. As soon as conditions degrade though, and FlexNet has to re-send, it first backs off on the parameters, sending less frames at a lower PACLEN until resends no longer occur. Then after successfully sending several times with no resends, it will experimentally bump the parms up a little bit, just to see if it can get away with it. It's kind of fun to watch in action, and it is significantly faster and more reliable than old style packet stuff.

Still, the idea of PSK31 on FM is interesting. You sure can't hurt anything by trying, and it might be a lot of fun. I'd say go for it.

Well http://www.arrl.org reported today that Mark Shuttleworth made some
voice-contacts over North America.
If the crew is using the voice-station they switch off the packet
because they interfere (both use the same downlink-frequency)
Maybe you got unlucky or they forgot to switch it on again, or did it
later.
BTW Shuttleworth did make a school-contact over South Africa too, if I'm
correct.

They should have sent a Commodore 64 with Baycom instead of the stupid TNC!

Every time I read about this ISS amateur station I wonder if the guys who run that experiment have ever considered using experience from earlier missions, and their successes and failures, in the next experiment...

First they send up an off-the-shelf TNC without thinking about modifying the defaults table to the "correct" values for this experiment (the most visible effect of this being the station identifying itself as NOCALL), and when this gross error is rectified by sending a new station up, they again send a TNC.

Amateurs-on-the-ground know that a TNC was a suitable way to setup a packet system 15 years ago, but now?

Rob

I have used the hamcom program on a 486 and it worked fine. When I switched to win 98 and a new computer I started using the free sound card programs so I can;t say but suspect it might be the timming of win 98 or newer operating sustems. The interface does work in the new computer to decode some other digital signals that I have windows 98 programs for from the scanner.

I use a program called SatScape. It's free from www.satscape.co.uk. It's pretty large because it has a lot of fancy graphics, but it works very well.

Hey, we are all human, and do make mistakes.
The reasons for this limited station were never well explained but I can
imagine some reasons.
- limited amount of weigth
- limited amount of available power
- limited amount of crew-time
- maybe even limited amount of funds
So don't blame anyone for trying, instead you could contact them and see
what you could do to improve the situation. That would really be in the
spirit of ham-radio.

It's also used in cellular systems. Search for "rake receiver" in
www.google.com .
Don't know if it's applied on HF as well. Guess that MT63 is trying to
achieve similar benefits using time and frequency diversity.

Some of 'em can't provide the voltage for the interface.

Alan.

Two things

Volts on the interface - feed in +12v via a diode to where the existing diodes provide +12v.

Modern PCs don't use real 8250/16450/16550 UART chips any more - they use either the Winbond or National SuperIO (or equivalent) chip. These are supposedly compatible with the older chips but there are areas in the timer/counter for the PC tick and limited bit values (some don't support 5 or 6 bits/char).

A final possible problem is make sure you are booted into real DOS, not in a DOS box. The UART drivers operate an emulation of real mode from the ring 0 32 bit windows driver for a DOS box which doesn't behave the same!!

Hi,

Anyone out there who has made up their own serial cable for a Universal M-7000 Communications terminal to a PC COM port? The connections are non-standard and the makers and software writers seem reluctant to provide the information.

TIA,
--
Roger Basford

Hello All,

I just have uploaded TrueTTY 1.92 into the main site and mirror:
      http://www.dxsoft.com/truetty.zip
      http://www.hamport.com/truetty.zip

Best regards,

Sergei
http://www.dxsoft.com

==

TrueTTY Versions History

V1.92
The command "File->Open Buffer in Notepad" was made. It saves receiving
buffer in a temporary file and opens this file by a text editor. Then you
can view this file or print it. The hotkey of this command is Ctrl-N.
This command is available in registered version of the software only.
A bug with the "List index of bounds" message appearing during editing of
text to transmit was fixed, I hope.
V1.91
The "Setup->Catch Words in Contest Mode" option was made.
In this mode software doesn't use popup-menu to catch word to logger.
TrueTTY recognize callsign or control number automatically.
The "Setup->Beacon Off At Mouse Click" option was made.
If this option is enabled, beacon is switched off by mouse click on
spectrogram, RX window or input window or by key pressed in the input window.
The "Setup->Continuous Carrier While Idle" option was made.
If this option is enabled, TrueTTY doesn't use idle symbols in RTTY and ASCII
modes.
Some minor bugs were fixed.
V1.90
UHF-PACKET (1200 Baud) decoding was made.
The "Grid" option was added to context menu to transfer received
QTH-locator to logger.
The 182 Hz shift value was added to the shift menu. This value is optimal for
interchannel crosstalk reducing at 45.45 Baud speed.

Wanna set up Packet Radio (ie HAM radio, but with data transfer) so that my close circle of friends and I (radius of about 3 miles hence not 802.11b) can have our own private network... Maybe even forming a larger network if more people join... Anyone think of a package that would suit us, or even a club we could join in Nottingham? When I say package, I know there isn't a Do all and End All package, I just mean the basic reqs for such a system including licenses etc... Any ideas?

In addition, I would also like speeds in excess of the 1200bps most people talk about, is there anyway of acheiving ~128kbbps? I realise it's very fast, but I mean, if people can do 54Mbps over 802.11b, then I presume it's gotta be EASY to adapt it.. Hasn't it?

Thoughts and ideas, most welcome and indeed encouraged...

Thanks in advance for any input you may be able to provide!

NB) Sorry if I sound somewhat ill-advised, I'm a computer guy, not a HAM radio user, although I am interested in this area too!

Well that speed you mentioned I DOUBT THAT! 9600 baud
Is common on HF, and 1200 Baud is common on VHF.
Straight packed is quite simple on VHF and reliable.
Each make of TNC (thats the controller you need between
your computer and radio) has its own software usually.
Just to startle you a bit,   I am still using a Commodore 128
computer on the INTERNET as I type this msg.   I also use
Another C128 on the other side of the room for PACKET
(VHF) only.   The software is super duper, and was written
in what was called WEST GERMANY back in the late 80's.
It still serves me well.

Oh right, well, actually I use an Amiga 50% of the time, A1200 to be
precise... Good to see taht old style hardware is still used! Anyway, I've
been hearing of 76800baud connections mainstream in the USA... Am I being
malinformed? Also, a lot seems to be done for Win3.11 style machines circa
1993 onwards... Has the scene come on at all since then? Iw ould have
thought that with recent advances in comms technology, that speeds would
have spiralled upwards... Anyway, thank you for your input, it has been most
useful to me, and I'm sure my friends when they read this. Thank you veyr
much.

Thanks for the reply. I found out that I was only listing the VISIBLE passes. I ahve since corrected that error. Unfortunately I am now looking at a webpage that lists EVERY ham satellite and when it passes over, instead of just the ISS, which is really what I want.

There hasn't been any spiralling in amateur radio recently, or it should be the spiralling downward of interest in the packet network.

Just because the commercial guys come up with new techniques and new applicances does not mean the amateur radio world automatically follows....

Of course you can use such a wireless LAN device as a radio amateur, and have some privileges that a normal user would not have, but in general the packet radio network hasn't moved forward since the early ninetees.

Rob

The problem is that they have to use hardware that's been certified
for the Shuttle or ISS (a long, tedious, and very expensive process).

In that case you'd be better off just using FM voice. As Dana noted, the
problem with using PSK31 over FM is that the wide bandwidth of the
modulation negates the weak signal advantage of PSK31. In other words,
PSK31 works so well in noisy weak signal conditions because it is a very
narrow bandwidth mode (like CW Morse), and can take advantage of
very narrow receive filters to reject most of the noise and interference.
Using FM eliminates that advantage.

Of course if signals are good enough for voice communications on FM,
then PSK31 over FM will work too. But there's no advantage to doing
so. If you just want to play, then fine, but it doesn't bring anything
particularly
useful to the table when used that way.

Try the Rochester Area Packet Society (RAPS) . They built a
decent quantity of boards and probably still have them.

I would like to get started with packet satellites. I live in a very rural area of South Africa - there is absolutely NO ground based packet within reach of me. I'm a no-code ham so HF is not on my licence.

I have a 2m/70cm Dual band Alinco DR610. It has different methods of connecting for 1200 and 9600 bps packet. I have read quite a bit on using a

pc soundcard in place of a TNC
Sound cards being ubiquitous and TNC's are VERY expensive here. I also came across a device called a "Rigblaster" made by www.westmountainradio.com - the simplest model they make is about as much as I could afford due to an extremely bad exchange rate.

Would the 2 different connection methods for my radio be a problem?
Is such a set-up as good as a real tnc - or would I be missing something?
Are there any good beginners guides for packet available anywhere?

Good evening, ladies and gentlemen.

While I was listening through the 20 MHz band tonight, I came across a digital mode I couldn't quite identify. It sounded almost, but not quite, like DTMF. It consisted of a few (8 to 12?) tones, of which one or two were transmitted simulataneously. There were about four frequency shifts each second.

I should have made a recording of it, but I was too busy fiddling with various digimode software (such as Stream and MixW) trying to get it to decode, and then it stopped.

Can any of you, on the basis of my description, make a guess on what it is that I have heard? Thanks in advance.

not sure but 14.080 is where rtty is or 14.069 for psk, I would bet on the
rtty and someones rig is off a little.

Just my guess, I checked out the freq with my trustless scanner picked up
some faint tones on WFM but there was too much rfi for the little scanner.

It was probably MFSK16 (think that 14.080 usb mode) is the calling frequency so to speak for that mode. The psk31 that someone mentioned is usually 14.070 and up just a hair. If you would like to decode it or some other digital modes go here:

http://www.muenster.de/%7Ewelp/sb.htm

for some sound card programs. Try hamscope for many modes.

YOu will not be able to do much with most of the digital modes on the lowbands with a FM receiver. They are normally received with a receiver set up for SSB or if you have it, the rtty position which uses much the same type of demodulator circuit.

Yea I know and I need a good antenna too. Actually my father and I have a Yaesu ft-840 for hf and we are putting up a Van Gorden Shorty up around 30 -35 ft. We are in the process of moving the shack upstairs to a nice room instead of the basement. Hook the rig blaster and Kam+ up and where good to

```
go.
   I just had the scanner handy so I had a listen nothing except on WFM.
Figure the antenna not tuned for hf anyways but I usually can pickup 40m cw
on 7.040.

I sold an MFJ 1278B Multi-Mode TNC to a guy but did not have a manual for it
(think I lent it to someone and did not get it back).  I told him when I
sold it I did not have the manual, but he could sure use one.

Anyone have a copy that they could possibly spare?

Thanks,

Duffy - WB8NUT

Wow, Awesome site.  As an old Signals Intelligence type, this is a really nice
site.  Thanks for finding & putting it on here.  Don't worry, I'm retired from
that old line of work.

Read the description again more carefully. Two tones simultaneously,
changing four times/second, cannot be MFSK16 (never more than one tone at a
time, changing 15.625 times a second). LA6AKA's original description below
fits much better with Throb (4 baud version). This mode was invented by
G3PPT (see http://www.lsear.freeserve.co.uk/page3.html for info). DL5SWB has
written an enhanced version of the original program, but many people trying
this mode nowadays are using the MixW software (http://mixw.net).

I have a perfectly working Magellan GPS300 unit that I don't need. This is a beginner/starter unit with waypoint store capability etc but no output to computer/peripherals. Runs off AA batteries. Do you have a need/application?

Asking $35 plus shipping.

TIA
Rick

When I bought mine used from a local ham store, it did not have the books. I
called MFJ they sent me a replacement set for free, so do not know what they
cost because of that situation. All I know is copying would be a bear as the
book is about as thick as the ARRL General Class study guide and bound in
the same manner.

Duffy,

A lot of MFJ manuals are available for download from
http://www.mfjenterprises.com/manuals.php They don't list the 1278B but
maybe if you contact MFJ they might send you a copy by e-mail?

I tried that but they did not make a PDF due to the size of the books. The
hardcopy was the only action available. BTW I just created a 160 page manual
that was text with simple line drawing it was 22 Megs big their book is
atleast 50% bigger than than that.

Yes. You can use the ACC(1) connector for transmit audio input as well
as a fixed level receiver audio output that will not vary with the
volume control setting. Take a look at March 2002 QST, page 31.

Hi all,

My friend ON4AKV and I have been playing around with some
Packet programs during the last weeks. We installed
Winpack - AGW 6.70 and it runs fine on 9k6 speed.
But till now we could not find any program that is able to
get the binarie files from the ON0RAT-8 bbs (satelite
pictures and virus-updates are BIN files !).
Yapp or 7PL are handled fine under the Winpack soft , but
BIN ? ? ?
I can easily switch between my old TOP or SP packet programs
and AGW to download the BIN files.

But... when my friend does the same , his Dual port modem
listen to the 9k6 signal on port 2 , and starts sending his
reply on port 1 in 1200 baud ! ! !
This strange behaviour started after he installed AGW.
Is there some instruction parameter in the Kantronics that
can be altered to make this thing act normal again ???
In TERMINAL-mode any port can be chosen and all traffic goes
to the chosen port , only in KISS-mode the KPC 9612 listens
on both ports but always reply on port 1 .
In brief : 1� How to get BIN files with AGWPE ?
2� How to make the KPC 9612 act normal again ?
Reply to this newsgroup
or if it's easier for you in French / German / Dutch send it
to : tony.winnen@skynet.be

Tnx for reading,
Tonny on1dnf

I never thought to post a for sale here, but saw another guy's posting of a
gps, so here goes mine too.

I have the Map330 in the box, upgraded firmware, map software and pc
interface. This is a really nice gps, and I'm sure would work great for aprs
or whatever it is called. I have two of these, actually, but the other has
the mounting bracket and dual interface cable and would cost more in anyone

wants that one.

$145 for the Map330

$170 for the Map330X (with mounting bracket and dual cable)

I'd take a dualband moble or ht in partial trade?? What have you??

Any good shareware packet terminals out there? I am just getting into Packet
and need something easy to use.

You can win a free copy of APRSPoint, the critically acclaimed
implememntation of the latest APRS standards. Just visit
http://www.aprspoint.com to enter for a chance to win the APRSPoint
package which includes Microsoft MapPoint 2002 and APRSPoint license
key, a $149.95 value. No purchase necessary. Visit the website for
details. Thanks.

The discriminator out has a 5kHz roll off if your interested. So using it for higher modulation rates is out of the question on a stock Winradio. The 3XXX-DSP versions apparently has the DSP on the audio only. Not on the IF. If you are keen, why not get a Eval Board from

http://www.national.com/store/view_item/index.html?nsid=CLC-EDRCS-PCASM

choose your DSP and your on a much higher plane.

Thanks, but that was the first place I looked.

The info there is all several years old, and I see no mention of users/groups/usage in specific areas.

Wow, last info here appears to be about a year old.

What are people doing in packet around here -- seems there are still
1200baud connections, but that's mighty slow.

Thanks for the tip.

I did buy a Winradio 3150e. This is the external version. I had to buy it because it's nearly impossible to find a 2+ Ghz computer that still has ISA slots. I don't know what the people at Winradio are thinking by not having a PCI product.

Anyway, I got the radio. Nice packaging. Decent software. Horrible performance. Lots of images, terrible de-sensitization, poor audio quality. For $2000 I expected a lot more. My $400 Bearcat scanner sounds better than the Winradio.

I returned it a week later.

John

That is the normal situation in amateur packet.

I guess the network maps didn't work for you... When I looked at them, there were the 19.2 and 9.6kb stuff, plain as day.

You must be totally unfamiliar with packet, if you are amazed to find 1.2kb stuff.

I'll also note that you do not appear to be genuinely interested in operating or participating in packet, but in "dissing" it, instead.

My guess is that you are one of New York's old LandLine Lid community, displaced when hams up there went back to using amateur radio, a few years ago. - It all seems so pointless to you, when hams use radio to communicate.

You don't really care about operating packet in New York... You just want to bitch.

I used to have a girlfriend like that. If I had known that you were a sniveling whiner, I wouldn't have bothered to answer your post...

Well, I know now. You're just another troll.

I don't know about the amateur 2m packet in the area, but Army and Air Force
MARS
have a functional VHF packet backbone from Maine to Washington DC.  And it
is
growing!  We also have an active HF PACTOR network (finally starting to
replace our
old HF Packet).

For Sale: Wireless Digital Communications by Tom McDermott, N5EG
Published by the Tuscon Amateur Packet Radio Association (TAPR)

Not doing much digital amateur radio lately, so thought I'd get this book into the hands of someone who can use it. TAPR sells it new for $40.00, you can have this one in like-new condition for $29. I'll pay shipping in the U.S. I don't have the disk that came with book but you can get all the updated files for free from the TAPR website anyway. Full details from TAPR: http://www.tapr.org/tapr/html/Fpub.wdcdat.html

You sure are predisposed to judge people -- incorrectly.

FYI, I was very active in packet a bunch of years ago and am interested in getting back in.

I feel sorry for you that you've had such bad experiences with people that you've become a cynical, condemning buffoon -- in public no less..

Write all you want, it will be ignored.....

I HAD A VERY OBSCURE PROBLEM WITH RIGBLASTER UNIT WHICH HAD WORKED OK WITH KENWOOD TS2000 FOR 5 MONTHS THE N WOULD NOT "RECOGNISE" ANY COMPORT ON MY P.C.---SENT E-MAIL TO WESTMOUNTAIN RADIO WITH DESCRIPTION-ALL SYMPTOMS   AND HOW CONNECTED -ON 16 TH APRIL. SET UP STILL WORKED IN VOX MODE(WHICH I DO NOT LIKE--SETTINGS TOO FUSSY) AFTER ONE OR TWO QUESTIONS AND ANSWERS-BY E-MAIL THEY SUGGESTED THAT THEY COULD BETTER DIAGNOSE THECAUSE OF THE PROBLEM IF THE Y PHONED ME WHILE IM IN MY SHACK---IN GLASGOW, SCOTLAND--BELIEVE IT !! HOWEVER WHEN I LATER INFORMED THEM THAT IHAD BORROWED ANOTHER RIGBLASTER --ALSO ORIGINALLY SCOURCED FROM U.S. THEY ASKED FOR CONFIRMATION OF MY ADDRESS AS THEY HAD DECIDED TO REPLACE MY DEFECTIVE BOARD.   SO TODAY MONDAYAPRIL IT ARRIVED AIRMAIL AND IVE JUST FINISHED REPLACING IT AND EVERYTHING WORKS JUST DANDY. DULL MARKS TO DELL SCHIER'S CREW AT WEST MOUNTAIN RADIO FOR THEIR
REAL HELPFULL NO QUIBBLE ATTITUDE .I'LL
CONTINUE RECOMMEND THEIR PRODUCTAND SERVICE -ON THIS SIDE OF THE POND.
 I LOVE PSK31 BY THE WAY   73 DE GM0LTQ

Hello..
I am a SSTV Newbie.
NSS

I installed W95SSTV and hooked up my headphone out (radio) to my line
in (computer) and I can hear the radio thru my computer speakers.
When I first turn on W95SSTV (sometimes) I get movement in the
spectrum window and an indication in the other field of the field
strength.
One I hit "Recieve" to get a picture that is coming on the air the
field strength locks up and there are no more green squiggly lines
showing me spectrum. Needless to say I have not recieved a picture
with it yet.
I did recieve a "white noise" picture once, but only once.

If you can point me in the right direction or tell me what I am doing
wrong, Please do so...

Thanks soo much

Ed

Amateur Radio Newsline™ Report 1284 - March 22 2002

Amateur Radio Newsline report number 1284 with a release date of Friday, March 22nd, 2002 to follow in 5-4-3-2-1.

The following is a Q-S-T. Ham radio and the FCC join forced to find a wayward transmitter jamming a fire department radio. This story is first on Amateur Radio Newsline report number 1284 coming your way right now.

(Billboard Cart Here)

**

RESCUE RADIO: HAMS ASSIST IN TRACKING DOWN WAYWARD TRANSMITTER

Ham radio operators teamed up with the FCC to track down a wayward transmitter. One that was making communications very difficult for the Fallbrook California fire department. It took place the weekend of March 10th. Amateur Radio Newsline’s Norm Seeley, KI7UP, has the rest of the story:

--

Milt Davies, KD6UBA, is Division Chief of the North County Fire Protection District. He was the first to identify the problem as radio frequency interference.

Davis described the annoying signal as being an unmodulated carrier pock-marked with strange data-like bursts. Sometimes the jamming transmitter was on-the-air all the time. Sometimes it was on and off. And at still other times the signal almost disappeared - transmitting only a few seconds in a 10 or 20 minute span.

Davies recognized the problem as on-channel jamming. He also knew that he needed outside help. That's when the FCC and the local ham radio community were notified.

First to try was the FCC. As you know, the agency has a series of permanent direction finding stations on the West Coast. These can be operated by remote control from Washington, D.C..

The FCC's weekend duty officer attempted to pinpoint the source of the interference using them, but with only partial success. Some of the locations were down for servicing. The result was a single line-of-bearing. This meant that the interfering transmitter could be anywhere along a 45 mile path.

To help home-in on the transmitter's location, members of the Palomar Amateur Radio Club were called out. They were asked to listen to the fire dispatch frequency and give signal strength reports on the unmodulated carrier. These reports, coupled with the FCC's own line-of-bearing, pointed to the City of Vista, or vicinity.

Now the hunt again became the domain of the FCC. Bill Zears, the District Director in charge of the FCC's San Diego Field Office, arrived with a sophisticated direction finding vehicle. Zears drove to Fallbrook for his first good bearing. That sent him off toward the rugged eastern portion of Vista.

At about the same time, a fire broke out in the Camp Pendleton military complex which borders Fallbrook. The jamming signal was preventing firefighters working the Pendleton fire from communicating directly with their Dispatch Center.

Zears stayed on the job as Sunday afternoon turned into evening. Finally, enough direction finding bearings were available to pinpoint the wayward transmitter to a 30' tower atop a hill in east Vista.

The Vista Fire Department was called. The Battalion Chief on duty offered immediate help. It turns out that a local ham had brought him up-to-speed on the interference case earlier in the day.

Then another ham recalled that the City of Vista once had a transmitter up on the suspect peak. That old VHF transmitter dated back to the days before most communications had moved to the 800 MHz band. He also knew that the old box just happened to be tuned to Fallbrook's current VHF dispatch frequency - because that was Vista Fire's old frequency!

The crew lost no time in getting up the hill and confirming the location of the offending transmitter. Nobody knows why power was still connected. Probably an oversight by some long forgotten radio installer. None the less, it caused the Vista's Fire Department to unintentionally jam Fallbrook, but pulling the power plug made the interference go away.

For the Amateur Radio Newsline, I’m Norm Seeley, KI7UP.

--

Thanks to the cooperation of everyone involved and the tenacity of FCC District Director Bill Zears, the situation had a happy ending. (W6VR)

**

OLYMPICS FOLLOW-UP: HANDI-HAM CARRIES OLYMPIC FLAME

The 2002 Winter Olympics may be over, but now comes word that a visually impaired ham radio operator was among those who had the honor of carrying the Olympic Torch.

Kitty Hevener, WB8TDA, and her trusty guide dog SunStar, carried the Olympic Flame on Saturday January 19th. This, as it made its way to Salt Lake City Uath.   Kitty's segment took the flame up to the gates of Fort Point, in the shadow of San Francisco California's Golden Gate Bridge.

According to the Handi Hams, Kitty Hevener, WB8TDA, is active with that group as well. Handi Hams says that she is a regular volunteer at the annual California Radio Camp held at Camp Joan Mier in Malibu California every March.

You can see photos of WB8TDA carrying the Olympic Torch at www.graystuff.com/gallery/kitty. (HandiHams)

**

ECONOMICS: JAPANS ECONOMIC RECESSION MAY AFFECT RADIO PRICES

The price of ham radio gear and other goods manufactured in Japan may soon change, but its unclear if it will be up or down. This on word that Japan's economy has fallen into the worst recession in at least two decades. The last time the Japanese economy contracted for three quarters straight was in 1993, when it shrank at around 0.1 percent each quarter. Before that, Japan had never seen even two back-to-back quarters of contraction - the usual definition of a recession - since the government began keeping such records in 1980. (ARNewsline(tm) from published news reports and ARNewsline(tm)interviews.)

**

EMERGING TECHNOLOGY: WSJT TAKING ON THE WORLD

Meantime, a new mode of operation seems to be taking Amateur Radio by storm. We have reported on it before: WSJT. And it lets everyone get in on what used to be the esoteric operation called meteor scatter. Q-News Graham Kemp, VK4BB, looks at the way WSJT is taking on the world:

--

WSJT is a digital mode, designed specifically for meteor scatter communications. It stands for Weak Signal communications by Joe Taylor K1JT. Its advantage for is that it sends extremely fast in a standard SSB bandwidth at 147 characters per second or about 1700 words per minute. By virtue of this speed it is possible to send two call signs and a signal report in a tenth of a second meteor ping.

The equipment to make WSJT contacts is fairly modest. A two meter SSB transceiver and a computer -- a Pentium, at least 75 MHz is the main hardware required. Then you need a simple PSK-31 interface box, as described in March 2000 AR magazine and some WSJT software.

An RF power output of 50 is the practical minimum, with 100 watts providing a worthwhile improvement. A major advantage with WSJT is the small antenna system required. A five element Yagi will do as well as a 10 element Yagi.

From Q-News Australia, I’m Graham Kemp, VK4BB for the Amateur Radio Newsline.

--

More information and the necessary software is at the official WSJT website. Its in cyberspace at pulsar.princeton.edu/~joe/K1JT. (Q-News)

**

Break 1

From the United States of America, We are the Amateur Radio Newsline, heard on bulletin stations around the world including the CARES repeater on 146.73 MHz and serving Gulfport Mississippi.

(5 sec pause here)

**

ENFORCEMENT: THAT CHARGE SHOULD NEVER HAVE BEEN FILED

The FCC has told a Midway, Tennessee ham that his complaint about a club repeater has no basis in fact:

--

Hollingsworth: “We dismissed a complaint filed by Jeffrey Bible, K4MFD, of Midway Teneseee. His complaint was against the Andrew Johnson Radio Club repeater W4WC which is located on an adjacent tower.”

“We found that despite allegations, the W4WC repeater had not lost coordination just because of a move. The move was within the coordinators limits. In fact, the repeaters have been operating for years with no problems.”

--

That was the FCC’s Riley Hollingsworth, K4ZDH who also says that both parties are coordinated, so both will have to work together to solve any interference that might arise. (FCC, RAIN)

**

ENFORCEMENT: FCC REFUSES TO INTERVENE IN ATV REPEATER DISPUTE

The FCC has also declined to intervene in a dispute involving two Mid-West

Amateur Television repeaters. One owned by a major radio club and the other by an individual. The main reason. There is no coordination for ATV in the area. The FCC's Riley Hollingsworth explains:

--

Hollingsworth: We notified Adrian Oaks, KB8GRJ, of Xenia Ohio that we would not get involved in a dispute that he has with the Dayton amateur Radio Association over the operation of an ATV repeater. Dayton's repeater, W8BI, has started occasionally operating on frequencies registered to Oaks. I emphasize registered nor coordinated. There is no coordination program there for ATV repeaters. But there's no showing of actual interference."

"DARA uses it for 20 to 45 minutes a week. It makes the repeater codes available to all so that anyone receiving interference can shut off the repeater. It is (also) willing to adjust operating times to accommodate other ATV users."

--

Hollingswoth says that there is no real conflict and therefore the situation does not warrant any FCC enforcement action. (FCC, RAIN)

**

ENFORCEMENT: PRE OPERATION LEADS TO LICENSE SETASIDE

The FCC has told a newly licensed ham that his license grant has been set aside. In a letter to John A Green, KG4RFI, of Mobile Alabama, the commission says that it has information which indicates that he operated on the W4IAX repeater and was also heard at various times on repeaters on 146.685 and 147.090 MHz in the Baldwin County area. The FCC says that all of these transmissions were made during a time that Green did not hold am Amateur service license.

Green was given twenty days from the date of the FCC letter to him to write back and explain certain issues. This includes any instances between the cancellation of his General Class license on September 14, 2001 and the grant of his Technician Class license on January 24, 2002 in which he operated any Amateur Radio transmitting equipment. (FCC)

**

BAMES IN THE NEWS: KD7DDG LOOSES AZ MAYORAL RACE

A follow-up to the story of Tim Weaver, KD7DDG, who was running for the office of Mayor of Glendale Arizona. Well, the votes have been counted and Weaver was not successful in his bid to oust the eight year incumbent Mayor who had the backing of the firefighters union.

The count showed that Weaver had polled only about 24% of the votes needed. Weaver says that the results were disappointing, but respectable for someone outspent and out-volunteered. (RAIN)

**

NAMES IN THE NEWS: RAIN CONTINUES CLEGG RETROSPECTIVE

Hap Holly, KC9RP tells ius that this weeks RAIN Report is part two of a retrospective look at famed ham radio pioneer Edward T. Clegg, W8LOY. This as seen through the eyes of his son-in-law Rob Mc Guffie, K2HZN. Its on line right now in digital streaming audio at www.rainreport.com or analog telephone audio at 827-847-7246. (RAIN)

**

NAMES IN THE NEWS: N9RLA FIRST CENTRAL DIVISION ROVER CERTIFICATE

Some names in the news. First is Dan Evans, N9RLA, who has taken first place as a rover station in the ARRL Central Division. This in the June 2001 VHF contest. Dan is from Scottsburg Indiana. (VHF Reflector)

**

NAMES IN THE NEWS: K8JAC NAMED KANAWHA HAM OF THE YEAR

Also, congratulations to Amateur Radio Newsline's own Jeff Clark, K8JAC. This, after being named Kanawha Valley Amateur Radio Operator of the Year 2002.

A ham since 1981, Clark's Amateur Radio volunteer activities include the post of Emergency Coordinator of Kanawha County, West Virginia. He is also Publicity Director of the Kanawha Amateur Radio Club, editor of the clubs newsletter and technical coordinator of the W8GK repeater. But thats not all. The local ARES group, which Clark coordinates receives high marks from county officials and is often called on to provide communications during civic events and emergencies.

Clark received his award on Saturday, March 16th at Charleston Hamfest. Another Amateur Radio Newsline anchor, Jim Damron, N8TMW, had the honor of making the presentation to K8JAC. (ARNewsline(tm))

**

NAMES IN THE NEWS: WA6ITF TO SPEAK IN JOPLIN MO

Amateur Radio Newsline producer Bill Pasternak, WA6ITF, will be the featured banquet speaker on Saturday April 13th at the Joplin Hamfest. The venue is the John Q. Hammon Trade Center in Joplin Missouri.

Situated about halfway between Tulsa Oklahoma and Kansas City, the Joplin Hamfest is a 200+ table event. It also features spacious parking with easy access, wide aisles, forums, ham radio testing and prizes.

Interested? More information is on the web at www.joplin-arc.org. (ARNewsline(tm))

**

BREAK 2

Here when you need us 52 weeks a year. We are the Amateur Radio Newsline, with links to the world from our only official website at www.arnewsline.org.

(5 sec pause here)

**

ANNIVERSARY: HAPPY 20TH ANNIVERSARY HEIL SOUND

This week marks the 20th anniversary of a very special company. We are talking about Heil Sound Limited. And when you talk about Heil Sound, you are really talking about its founder Bob Heil, K9EID.

Over the years, Bob Heil has been an audio consultant, an inventor, a musician and lots more. Looking back, He says that everything harkens back to his first love. His hobby. Amateur Radio:

--

Heil: “It’s been an incredible ride from a little kid playing pipe organ in the Fox (theater)n through playing with my Harvey-Wells and SX-99 which I still have, and understanding what it took to make all of these things.

“Then I started building different transmitters and then started building sound equipment.”

“We actually changed the world. We are the guys that figured out how you stack and hang speakers. Why? Because I could set up a Rohn 25G (tower) and hang speakers higher than anybody else because of my ham radio.”

--

After years of touring with such number one acts as the Eagles, Bob decided to give something back to the hobby that had lead to his success. Thats how Heil Sound Limited was born.

--
Heil: My life has evolved around 45 years of being K9EID, and I will always be so grateful to everybody in this hobby for allowing me to do my thing and along the way to help someone. Thats the bottom line that we are able to help somebody and it makes me real happy to be able to do that.”
--

Bob is now celebrating the beginning of the company’s third decade with a number of new and innovative products for every aspect of ham radio voice operations. You will get to see all of them in a few weeks and meet Bob in person at Hamvention 2002. (ARNewsline(tm))

**

HANDI HAMS: E-NEWSLETTER MAILING CHANGE

The Handi Hams says that it is changing the way in which the groups weekly e-letter is being distributed in HTML format. According to Handi Hams Pat Tice, WAZ0TDA, constant barrages of virus threats to Microsoft Outlook makes it risky to continue maintaining the HTML list in Microsoft Outlook. So the group is moving its list to a mailer called Group Mail. This says Tice will be bring with it minimal risk of sending a virus to the group of HTML subscribers. The text subscribers continue to receive the e-letter through Yahoo Groups. (HandiHams)

**

EVENTS: 2002 WEAK SIGNAL BANQUET

Tom Whitted, WA8WZG, reports over the VHF Reflector that tickets are now on sale for the 10th annual Weak Signal Banquet. This year the gathering will again be held in Dayton Ohio on Hamvention weekend. If you are interested in attending, more information is in cyberspace at www.wa8wzg.com. (VHF Reflector)

**

INTERNATIONAL - CANADA: RAC SM ELECTION RESULTS

From our neighbors to the North comes word that Tom Caithness, VE1GT is the interim Section Manager for Canada’s Maritime Provences. He was elected for a two-year term, which began March 1st.

Also, Derek Hay, VE4HAY was recently re-elected Section Manager in the Manitoba for a two-year term snd Joe Craig, VO1NA has been re-elected Section Manager for the Newfoundland and Labrador Section for a two-year term. Both take office on July 1st.

All three ran unopposed in their respective Radio Amateurs of Canada sections. This eliminated the need for a balloted election. (RAC)

**

DX

In D-X, the big story is of coarse Ducie Island. The VP6DI team came on the air on March 17th and its was bedlam. Take a listen.

--
audio here
--

Ducie Island is a small, uninhabited atoll in the South Pacific and is part of the Pitcarin Island chain. It is also among the rarest DXCC entities in the world as proven by the recording you just heard. It was made in Australia by VK4DX using a Kenwood TS-570D transceiver and posted to his contest website. (Audio courtesy VK4DX)

**

THAT FINAL ITEM: ARDF CHAMPIONSHIPS IN ATLANTA

And finally this week, the calendar says that its spring and hams around the country are turning to outdoor activities such as new antennas and hidden transmitter hunting. Here's your chance to prove you're the best at the latter activity, as Newsline's Joe Moell K0OV explains:

--

The biggest annual event in on-foot hidden transmitter hunting is early this year, so time is getting short if you want to take part.

The Second USA ARDF Championships will be April 19-21 at Franklin Roosevelt State Park near Pine Mountain, Georgia. That's about 70 miles southwest of the Atlanta airport. No matter what your level of skill or experience at radio-orienteering, you'll be welcome. Experts will be vying for positions on Team USA as it travels to Slovakia for the World Championships later this year. Beginners will be picking up the best RDF techniques from these experts, and learning how to put on similar events in their home towns.

The official deadline to register for the national championships is April 6, but Georgia Orienteering Club urges you to let them know you're coming by March 29, so they can plan food for the picnic supper on Friday and the spaghetti dinner on Saturday.

Learn more about what it's like to be in the ARDF Championships by reading about last year's event in the March issue of QST, and in December and January's issues of 73 Magazine. There's lots more on the subject at my Web site -- www.homingin.com -- plus a link to the registration site for the Pine Mountain events. That's homingin -- one word -- homingin.com

From sunny southern California, where we're soon having our third practice session of the year to get ready for the championships, this is Joe Moell K-zero-Oscar-Victor for Amateur Radio Newsline.

--

Again, that website is www.homingin.com (K0OV)

There is a VERY inexpensive way to run PACTOR!

For $10 or so you can run PACTOR!

Just pick up an old RTTY TU such as the AEA CP-1.
You can usually pick one up off EBAY for $10 to $20 US. (I got mine for $10 US)

Then download the TERMAN93 program from the web site of Tom Sailor HB9JNX.

TERMAN93 will run on ANY PC running DOS or Windows. It implements RTTY,
AMTOR and PACTOR (ARQ RX and TX). Best of all it is FREEWARE! It works
great!

Rob

P.S. There are other programs like BMK-MULTY that will work with the old
RTTY TUs. But they cost $$. BMK-MULTY is also VERY good!

Hi Roger,

Worth a try on SSB, listening to the ZL2AFP FM signal sounds narrow enough for SSB (a bit like SSTV). Not heard any activity on HF at all, except a short burst of the AM mode on the NBTV net (0800 UK time 3.7MHz LSB). The burst was too short for me to set up the software and I couldn't ask him to try again because I haven't got 80m aerials! There is a Dutchman wanting to start on 29MHz later this year... we shall have to wait and see what happens there.

Have you tried downloading the Paket61 program? What make /model is your new tnc? I started out with the tiny Tigertronics/Baycom steup and loved it. But since then have upgraded to a KPC3+ and love it even more. We can only hope to get more "Hams" active on packet..   Feel free to send me any questions, ...

Listen to sound samples at http://www.kb9ukd.com/digital/ .
MFSK http://www.kb9ukd.com/digital/mfsk.wav is the most "musical" digimode I know.

There's a special group for digimode skeds:
http://groups.yahoo.com/group/soundcard-mode-skeds/
But PSK31 is the easiest: Plenty of signals around 14070 at any time.

Hello all,

I am having a lot of trouble with the soundcard chipset in my small Sony Vaio. It does a terrible job of decoding PSK31 signals. My old Dell laptop with the same rig, cables and software decodes perfectly. I have been careful to set the input audio levels on both computers appropriately.

One solution that has been suggested is to bypass the chipset in the laptop with an external USB-based sound device. I wouldn't mind this if one could be found that is reletively small and easy to transport. Alternatively, I would prefer a PCMCIA solution if such a product exists.

Any advice about products or other solutions would be greatly appreciated.

Gregg,

Yesterday, I read that Creative have a new external "sound-card" called the 'Exigy' or something like that. Should be ideal for laptops. I recall that it connects with a USB cable.

I'm want to try PSK31 myself and if the laptop I end up with is troublesome, I may try the thing myself.

It is originating from ZF1AIT and it is sent to TG9BD CO7GG and XE1PM.

Looks like BBS forwarding.  What is so particular about it?

Best to get PaKet 6.2 cause it's Y2K compatible. Works great, even on a lowly 286. Good luck!

Amateur Radio Newsline™ Report 1285 - March 29 2002

Amateur Radio Newsline report number 1285 with a release date of Friday, March 29th, 2002 to follow in 5-4-3-2-1.

The following is a Q-S-T. Russia orbits a new but temporary ham radio satellite and the ARRL says its time to re farm the Novice bands. What is refarming? Find out on Amateur Radio Newsline report number 1285 coming your way right now.

(Billboard Cart Here)

**

HAM RADIO IN SPACE: RS-21 IN OBIT

Yet another ham radio satellite is now in space. This one is the Russian Radio Sport 21. Roy Neal, K6DUE, has the details:

--

Meet the latest ham radio satellite: RS-21. The newest ham radio satellite.

The satellite's formal name is the Russian-Australian Scientific and Educational Microsatellite Kolibri-2000. To most hams however, it is simply Radio Sport 21.

According to the AMSAT News Service, the new ham-sat was remotely launched on March 20th from a Russian Progress M-1-7 launcher that had brought supplies to the International Space Station. That launch took place after the Progress ship had un-docked from the I-S-S.

Alex Zaitzev, RW3DZ, the director of the Microsat Office of the Russian Space Research Institute, describes RS-21 as a non-government, non-commercial project, built with cooperation from students in Russia and Australia. It is currently in a circular orbit just over 200 miles above the Earth and on the air. Downlink frequencies are listed as 145.825 and 435.335 MHz.

The birds uses both CW and FSK for its telemetry transmissions, but it wont last very long. Zaitzev says that RS-21 was designed with a limited lifespan and that it will fall back into the atmosphere during the late winter or spring months. Till then though, RW3DZ, says that the satellite will send down data and digitally recorded voice messages.

For the Amateur Radio Newsline, Roy Neal, K6DUE.

--

Meantime, the L.A. Daily News reports that the current crew on board the International Space Station will be spending an extra month in orbit. Russian Cosmonaut Commander Yuri Onufrienko, RK3DUO along with American Astronauts Carl Walz, KC5TIE and Dan Bursch, KD5PNU will spend the time correcting problems with the Canadian built robotic arm used for ongoing I-S-S construction. This will mean the crew will be on board for a total of 189 days. This will be a new record for the US crew members on board the International Space Station. (AMSAT-NA)

**

HAM RADIO IN SPACE: HIGH SCHOOL CHEMISTRY EXPERIMENT TO THE ISS

A small science experiment at two Bloomington, Indiana High Schools is now headed for the International Space Station. A ham radio operator is helping to make it happen. Amateur News Weekly’s Jack Parker, W8ISH, has the details from the home of Indiana University.

--

Eleven honors chemistry students from Bloomington North and Bloomington South High Schools have collaborated with NASA to prepare a protein crystal growth experiment. The protein, frozen since November, is now ready to be transported to the International Space Station.

Bloomington North advanced chemistry teacher Neil Rapp, WB9VPG will join the students as they travel to the Kennedy Space Center for the April 4th launch of the Atlantis space shuttle. Once the experiment is aboard the International Space Station, it will thaw and allow the crystals to grow. After the crystals are formed, they will be transported back to earth and studied by NASA, and eventually returned to the Bloomington High schools.

According to Neil Rapp, the formation of protein crystals is an important step in the development of drugs designed to cure various diseases.

Reporting for Amateur News Weekly, this is Jack Parker W8ISH.

--

All eleven chemistry students will be on hand for the launch of Atlantis. Each will receive a plaque and shirts designed to commemorate the launch of their experiment into space. (WB9VPG)

**

ARRL TO FCC: TIME TO RE-EVALUATE THE NOVICE BANDS

The ARRL has asked the FCC to eliminate the 80, 40 and 15-meter Novice and Technician Plus Morse code subbands. It also wants the FCC to reuse that spectrum, in part, to expand the radiotelephone allocations on 80 and 40 meters. Amateur Radio Newsline’s Bruce Tennant, K6PZW has the details:

--

According to the ARRL Letter, a Petition for Rule Making filed March 22nd, the League requests that the FCC revise its Amateur Service rules in accordance with the modified Novice band refarming scheme the ARRL Board of Directors okayed in January. The Petition has not yet been put on public notice for comment.

Refarming is a government-ese term coined a few years back. Its a way of saying that spectrum assigned to a given radio service will be reassigned for other uses within that service.   In this case, reassigning spectrum now primerally dedicated to Novice C-W operation to various other modes.

If the FCC approves the plan, current Novice and Technician Plus licensees would be permitted to operate on the 80, 40, 15 and 10-meter General-class Morse code allocations at up to 200 watts output.

The ARRL's petition also asks the FCC to permit amateurs to use spread spectrum on the 222 to 225 MHz band. It also requests an expand the pool of special event call signs beyond the 1 by 1 format to include identifiers for US territories and possessions that do not provide for mailing addresses. And it asks the FCC to clarify its rules to indicate that modulated CW is permitted for repeater station identification.

For the Amateur Radio Newsline, I'm I'm Bruce Tennant, K6PZW.

--

In its petition, the ARRL cited substantial advancements in the use of "digital techniques" in the HF bands such as PSK31 to bolster its assertion that a refarming plan is needed. The ARRL says that the Novice High Frequency sub-bands are underutilized and Amateur Radio cannot wait any longer on this issue. A copy of the ARRL's complete Petition for Rulemaking is available on the ARRL Web at www.arrl.org. (ARRL)

A NEWSLINE FOLLOW-UP: A POLITICALLY DISORGANIZED 11 METER CLASS D SERVICE

A few weeks ago we reported that the FCC has refused to hear an appeal by an Illinois C-B operator convicted of Disorderly Conduct for interfering with a neighbors home entertainment electronics. In the days since that report first aired, it caused quite a stir on several Internet discussion groups. Everyone wants to know how a service that once boasted 3 out of every 5 Americans with radios in their cars could wind up where the local sheriff or policeman could take an operator off the air.

After a bit of research, the answer seemed pretty clear. In one word: Politics. Here is Amateur Radio Newsline's South East Bureau Chief David Black, KB4KCH, with part 1 of a multi part look at the strange political side of 11 meter C-B.

--

When it comes to having political representation, most communication groups are in good shape. Hams have the American Radio Relay League looking after their political well being. Broadcasters have the powerful National Association of Broadcasters. Cellular telephone companies have the CTIA. Even the General Mobile Radio Service, which shares frequencies with the Family Radio Service, has representation amid the Personal Radio Steering Group. So, what form of communications lacks representation? That would be 11 meter, Class D Citizens Band radio. What does CB have? This:

--
Sound from 11 meter CB
--

Give CB a listen, and you hear lots of people using a service without any structure or formalized representation. Some might even call it anarchy.

--
More sound from 11 meters
--

Ironically, CB's lack of political power--as well as its inability to defend against bureaucratic attack--is not due to shortage of people using the airwaves. Many believe that next to cellular telephones, the second largest selling piece of 2-way radio equipment in the 20th century has been the CB radio.

During the gas crisis in the 1970s, many cars sported some sort of 11 meter whip and a cheap CB radio under the dash. Low cost 11 meter radios by the millions were manufactured, imported and sold. The industry had hobby magazines and several newspaper style newsletters devoted to CB radio.

CB operators outnumbered hams by at least 20 to one. And they outnumber GMRS users by 1000 to one.

But CB was not able to defend itself from outside pressures either back then or today. Why? Part of the reason goes back to CB’ers themselves in the 1970s and early 1980s. Most of them were not really interested in the service. It was just a utility. A way to help learn where to find the cheapest gasoline or avoid speed traps.

The CB radio service lacked any real monetary commitment. Without that, there was no political commitment. And when fuel prices began to ease, many but not all 11 meter operators pulled their radios out of their cars--and put them in the attic.

Then there were the few others, the die hard CB hobbyists. They treated CB channels 1 through 40 as a sort of ham radio-like hobby.   Some operated illegally, but would take the chance just to make a DX contact. But they never organized. Why?

Different CB groups formed over the years. Many called themselves political messiahs of 11 meters. But many turned out to be bogus.

During the late 1970's and early 1980's, C-B radio scam artists were busy, trying to separate the 11 meter radio operator from his hard earned cash.   As group after group appeared and then vanished, it became apparent to most using C-B that trusting anyone was too expensive. Now, more than 25 years later, trust in any C-B political organization seems little more than a remote possibility.

And what about the legal C-B operators? Those dedicated to public service? That part of the story, next week.

For the Amateur Radio Newsline, I'm David Black, KB4KCH.

--

Next week David tells us about the only successful C-B organization and the reason that it survived when the rest went away. (ARNewsline(tm))

**

SHORTWAVE: ARNEWSLINE VISITS AN SWL-FEST

From C-B to shortwave listening. Ham radio operators are not the only radio hobbyists who hold conventions. So do Short Wave Listeners and one of the most successful gatherings is Winterfest. Amateur Radio Newsline’s Steve Coletti took his tape recorder and visited this years gathering. He has this report:

--

AUDIO ONLY - NO TEXT. Download MP3 audio at www.arnewsline.org by clicking on the newscast number.

--

It may not be the size of the Dayton Hamvention or Huntsville Hamfest, but to Short Wave Listeners, Winterfest is truly the best. (ARNewsline(tm))

**

RADIO GROUPS: NEW MURS USERS GROUP FORMING IN CYBERSPACE

We have covered C-B and short wave listening. How about MURS -- the newly created Multi-Use-Radio Service. Well, according to an Internet posting, an organization called The MURS OPEN Group has begun work to form an Internet-based MURS User's Group. This group will be a non-profit corporation whose main goal will be to encourage the growth of Multi-Use Radio Service. If you are interested in learning more, you can visit the group in cyberspace at: http://groups.yahoo.com/group/MURS-OPEN/ (MURS Open Group)

**

CONVENTIONS: WELCOME TO HAM RADIO AT NAB

If you are planning a trip to the upcoming National Association of Broadcasters convention, be advised that the hams of Las Vegas are expecting you. Bill Croghan, WB0KSW, says that the Las Vegas Radio Amateur Club repeaters are up, active and hard linked.

Bill Croghan is the Chief Engineer of Lotus Broadcasting in Las Vegas. He says that on two meters try 146.94, minus 600 kHz offset with a 100 Hz access tone. This machine is now located on the Hilton hotel immediately above the Convention center, but on the opposite tower. From this site it should be useable from deep inside the Convention center and easily from anywhere on the Las Vegas strip.

If you would rather use a U-H-F machine try 448.500, minus MHz offset also with a 100 Hz access tone. This system is hard linked to the 2 meter machine but located on the old Tropicana hotel site as in years past. With the two systems linked any ham attending N-A-B with either a 2 meter or 70 centimeter radio can have fun and stay in touch. The convention takes place April 8th through the 11th at the Las Vegas Convention Center in Las Vegas, Nevada. (BEAN)

**

CONVENTIONS: WELCOME TO THE NAB HAM RADIO RECEPTION

Also, this years N-A-B Ham Radio Reception will take place Wednesday Evening, April 10th at 6 PM following the close of the exhibit hall. Location is the Hilton Convention Center in Ballroom B. The gathering is being co-sponsored by C-Q Magazine and Kenwood Communications. C-Q Publisher Dick Ross, K2MGA and Editor Rich Moseson, W2VU, along with Kenwood's Paul Middelton, K4NUH, will be there as your host.

Amateur Radio Newsline will also be loitering around the convention and the Ham Radio Reception. We will be represented by Producer Bill Pasternak WA6ITF and by Todd Hitzeroth, N6ZXJ, who serves on the Young Ham of the Year Award committee. (CQ, ARNewsline(tm))

EMERGING TECHNOLOGY: KERMIT AND THE V-CHIP

Sesame Street's Kermit the Frog has a new part-time job. According to news reports the little green guy will be put to work boosting the awareness of the television V-Chip.

The V-Chip is a mandatory internal accessory built into any T-V set larger than thirteen inches diagnal picture. The chip reads a digital code that contains a program's rating and can be programmed to block out television shows parents deem inappropriate for their kids.

Now the Hallmark Channel in conjunction with The Jim Henson Company, has donated the image of Kermit to the Federal Communications Commission for use in an upcoming promotional campaign to bring attention to the availability of the V-Chip. A new brochure to be distributed to the public by the FCC, the Hallmark Channel and other interest groups, will feature Kermit sporting a "V" with his fingers and urging parents to monitor the programming their children watch. (Published news reports)

INTERNATIONAL - CANADA: VE7BFK IS NEW ARDF COORDINATOR

Gordon D. Young, VE7BFK has been appointed as the Radio Amateurs of Canada National A-R-D-F Coordinator. Young first became interested in A-R-D-F when the Friendship Amateur Radio Society hosted the 3rd Friendship Radio Games in Victoria British Columbia back in 1993. He has since attended A-R-D-F events in Russia, Japan and the United States. He replaces Perry Creighton, VA7PC who has held that appointment for several years. (RAC)

**

INTERNATIONAL - ISRAEL: 500TH NEWSLETTER ON THE AIR

From Israel comes word that Mark Stern, 4Z4KX, recently celebrated the 500th edition of his ‘Newsletter on the Air’ for that nations Russian-speaking ham community. Stern, the former UP2OE, has been performing this service for the last 11 years every Saturday morning on 7.080 MHz.

Stern also seeks donations of used gear that he donates to newly arrived new-immigrant hams. As a result of his efforts many have gotten on the air in Israel in only a short time after their arrival in that nation.

And if all that were not enough for one ham, Stern is also the Israeli Award Manager and issues the awards and trophies for the Holyland and Israeli VHF-UHF Contests. (Hagal International)

**

DX

In D-X, hams are usually out looking for D-Xpeditions. Heres a twist. A future D-Xpedition is looking for you. Jeramy Boot, G4NJH, explains:

--

Have you always wanted to take part in a major D-Xpedition, but never known how to get on an expedition team? Now could be your chance. Ken Holdom, ZL4HU, the leader of 'The Kermadec DX Association's' planned operation from the Chatham Islands - ZL7 - later this year, is looking for experienced SSB and CW operators to accompany the group. "As this will be a 24-hour-per-day operation, we are looking for operators who feel they have the willingness and ability to operate during both day time and night time," Ken says. For further information please contact the Kermadec DX Association, PO Box 7, Clyde, Central Otago, New Zealand or e-mail to zl2hu@clear.net.nz.

--

Again, that e-mail address to apply is zl2hu@clear.net.nz (RSGB)

A D-Xpedition to San Felix became active on March 16th as X-R-Zero C. It was active for 14 days on all bands and modes. If you made contact, QSL via John

Kennon, N7CQQ, P. O. Box 31553, Laughlin, Nevada 89028.

Lastly, N6DE and K6EP will be active from St. Croix through April 2nd. During the CQ World Wide S-S-B Contest, they will use the callsign WP2Z. QSL WP2Z contacts via KU9C, and non-contest QSO’s to each operator's home callsign address. (Various DX sources)

**

THAT FINAL ITEM: AN APRIL 1ST CB D-XPEDITION TO THE ISLE DU CONEY

Earlier in this week's newscast we reported that 11 meter C-B has no political clout. What it does have is a bunch of people who just want to have fun. Now, a group of them is planning what they call a People's Radio D-Xpedition from an exotic island location. Roving reporter Pierre Pullinmyleg is here with the details:

--
AUDIO ONLY - NO TEXT. Download MP3 audio at www.arnewsline.org
--

Hopefully, Pierre will be back a year from now to pull your leg once again. (The April Fools Day File)

Does anyone have any idea what the life of an unused (as in brand new sealed)   LiIon battery pack should be? The e-bay vendors say their packs are about 3 to 5 years old and are sealed as in original IBM sealed batteries.

Should I get one of these battery packs from e-bay (sealed never used from original IBM sources), or should I get mine rebuilt (at greater expense) with more recent manufactured LiIon cells?

Is this the same situation for NiMH battery packs?

Checking QST back issues has not been definite as far as information goes.

I am trying to set my 706 MK2G to interface with my SCS PTC IIe modem to use with WinLink to use the 706 in a split AFSK mode with Pactor II..
The setup instructions that are with WinLink are either not clear, or have been written for an earlier version of the 706.

I have installed the 500hz FL100 filter as well as the High Stability Crystal as has been recommended.

The radio settings instructions from WinLink say in part:
"To set up the split ("AFSK")mode, first select the radio's RTTY mode, then go to the radio's Quick Set Mode ... and set Q@ RTTY TONE to 2125, and Q# RTTY SHIFT to 200. Then get into Set mode ... " (and this is where I get lost), "be sure that "transceiver" mode (item 27) is set, and set baud rate (item 26) to 19200 baud rather than "auto"

My problem is that Item 27 in my set mode is "A-TUNE STRT" for starting the auto tuner, and Item 26 is "PWR ON CHK" for causing the power on check.

The only place where I have an "auto" choice is item 35, "CI-V BAUD I don't think this is what the directions were referring to.

I don't see any choices for putting "transceiver" as "set".

Any thoughts on this?

A friend is looking at programs which will allow a laptop to send and receive at 9600 baud using the sound card interface to transfer information and pictures for use in emergency communications. An example would be to take a digital picture of damage and send it to the EOC. They have been experimenting with SSTV-type programs, but would like to work at a much faster transfer rate.

MIXW seems to do most of what is wanted, but there does not seem to be a way to transfer a binary file. It does support transfer of a text file, and there are some programs which allow the conversion of a binary file to HEX or MIME64. However, the emphasis here is to make it user friendly, and with a minimum of extra components. With MIXW, all you need is the patch cord to the radio.

Any ideas on this, or perhaps a good place to look? He has sent a note off to the author of the program, of course,

I've implemented Rob's extended address scheme, and the results seem quite promising on my "bad" 9600 baud link.

I have slow start, a heard frame queue, and a simple scheme to fall back to SABM when SABME fails. With a larger number of smaller frames in flight, the link throughput is improved by about 25 - 30%. Well worth the not very large coding effort.

Here is what I see as responses to the SABME from all the different AX.25 implementations I can find on air today:

TheNet Plus 2.12st does not respond. Retry out then SABM.
G8BPQ 4.06K on DE responds DM
Previous SNOS responds DM
K-net V1.0 responds DM
PacketCluster V5.4-52 responds DM

Yeah it is a pity that not everybody responds with DM or FRMR...
I think when I drafted the spec there were even stations that somehow
got disturbed.  I implemented a "list of stations that can accept SABME"
feature to be used in such cases (e.g. on a node local access).
On an interlink it usually isn't a problem.

Simple!!

Use the AGW Packet Engine and transfer any binary file using ANY SMTP EMAIL client like Outlook Express.

In other words just compose an EMAIL using Outlook Express and attach a file to it. Then send it! The AGW packet engine will transmit it the EMAIL and file over the radio using 1200 or 9600 baud TCP/IP packet radio.

The AGW packet engine supports 300, 1200 and 9600 baud packet using a soundcard or external TNC. You will need to purchase the IP/TCP option for the AGW packet engine. (It is VERY inexpensive. A real deal).

You should also be able to transfer a binary file using FLEXNET32 and any SMTP EMAIL client like MS Outlook Express. I think FLEXNET32 is free for ham use.

I believe MIXW can also be used this way to send files using TCP/IP. Read the docs or ask Nick.

Oh yes, you can also use AGW packet engine to send a binary file using
AX.25 instead of TCP/IP.

Use one of the great terminal programs for the AGW packet engine like
WinPack.

Rob

But I seem to remember reading that Li-Ion is only good for 1/2 or 2/3 the number of recharge cycles that a Ni-Cad will have.

Hi guys.

If you are interested in packet, either on vhf/uhf or hf, there is a great software for you to play with. It also has drivers for running tcp/ip. It's MixW by UT2UZ. Take a look and play. This software has more modes in it which use the PC soundcard than you can think of :-) Windoze of course.

http://www.g3vfp.com/download.html

Cheers,

Dave G3VFP

Greetings and thanks for reading this message..

It is with much regret that the news of John Eastaugh VK5GY passing, be posted to the Amateur community. I happened Tues 28th Mar

2002. He was a valued member of South Coast Amateur Radio Club Inc. [SA]
and will be sorely missed. We pass on our sincere condolences to his
family..

--
Regards,

Stef Daniels

Rob,

Thanks for the info. Nick was not aware of the need for that
capability, so it isn't in there. Perhaps later. Will take a good
look at the other options.

Hi,
I have an unbound xerox copy but it is large so I do not know how long
it will take to scan it then send it to you there in Croatia via
internet. Would regular mail be easear? I'll try scanning (some of) it
this evening.
Cheers KA3DWW

You do not need to play with the radio's 'tone' and 'shift' settings for AFSK, these are used for FSK only. If you are using the AirMail v3 software you really don't need to play with much of anything on the radio, most everything is easily set up from the 'Options' menu in the AirMail software.

Also, I assume that you realize that when using a PTC-IIe you will need a second serial port on your PC if you want to have the AirMail software automatically set the operating frequency for you.

On the plus side, once you get everything set up I believe you will find that the 706 and the PTC-IIe make a great combination.

Thus Spake "Bob Lewis \(AA4PB\)" <rlewis@staffnet.com>:

>The cheapest way is probably to find a good used TNC that includes
>Pactor. You won't find any Windows programs that will make a Pactor
>ARQ link using the sound card.
>
     MixW v.2 has a pactor mode for use with a sound card. While I
haven't tried it (I use it for PSK-31), if it's as good as the other
modes, it will do as well as an inexpensive TNC.

     Incidently, the MFJ-1275 sound card interface works well with
it and makes for a pretty inexpensive digital solution.

No, MixW can receive pactor. It does not transmit pactor. As far as I
know, there are currently no Windows based sound card programs that
can make a pactor or amtor ARQ link with another station.

I am in need of information for a part on my Texscan AL-51 Spectrum Analyzer. The 1 to 2 ghz oscillator is dead and I traced the problem to a stack of four tuning (vericap) diodes with a part number of MDT606. I have not been able to locate the part number or a cross reference to this part. Might anyone out there have information on the defective part; or perhaps an extra part (or even the oscillator module itself)?   Gladly pay reasonable costs.   Please respond to my email address. Thanks and 73's   Don Smith KB6GQA

I did a search on Google and Google Groups for an answer but I must be the first person to ask this question...

Does anyone have a wiring diagram/instructions for making an interface cable for an AEA PK-88 to a Radio Shack HTX-252 mobile?

If a pre-made cable can be found, that would be fine too.

Thank you for your help.

Steve

Alan,

I forgot to mention that Symek manufacturers HIGH SPEED packet radio modems and radios. With the Symek equipment you can send and receive packet at speeds up to 1.6 MBaud. (Much faster than Dialup Internet connections!) You can easily transmit and receive binary files and pictures with the Symek equipment but it is pricey!

See http://www.symek.com/g/index-g.html

If you want to transmit and receive binary files over HF, consider using PACTOR II or CLOVER II. (I prefer PACTOR II. In my view, you can more easily reach the higher speeds over typical HF conditions using PACTOR II)

For Pactor II -- see www.scs-ptc.com
For CLOVER II -- see www.halcomm.com

I DO NOT recommend using Packet for HF communications. It was not designed to cope with typical HF conditions (i.e. QSB, QRN, QRM etc). PACTOR and CLOVER are much better!

Rob

Try following the "Wiring diagrams" link on http://www.qsl.net/scdcc/links.html

At the site it points to, the PK-88 is diagramed. Some Radio Shack radios also have their relevent pin-outs listed.

AEA PK232MBX upgraded to PACTOR capability about three years ago. Still have original 1990 EPROM, if you wish. Comes with Manual plus updates, power cord, and new connectors for radio connections. You supply the specific wiring to your radio(s).

Unit is in very good shape, used only indoors and non-smoking environment.
Only owner.

Asking $100.

TIA, Rick N6CY

Broadcasting is not allowed in the amateur radio service.

That is correct. I'm trying now to find the factory source to back up this information...

Hello!

Does anyone here happen to know of a source in North America for an inexpensive 'Baycom' style packet modem? I'd like to see what packet is like in my area before I invest in a TNC (if that proves necessary).

Regards,
   - Andy KB9YLW

I found a new Baycom on EBay being sold as a close-out item.

They aren't the easiest device to get working under the Windows OS.
However, they work fine in DOS on old computers. I've managed to achieve
some degree of success with it in Windows, too.

I agree completely with Paul ... directive antennas and using
the 802.11b "Access Point" as a "hub" (similar to a digipeater,
NETROM node, or such) and sticking with the ~+15 dBm TX

power that's typically produced by standard 802.11b "client"
products is a more practical and economical solution ... and
one that's available NOW ...

> 800 MHz band with a repeater located at 20 km without line of sight
> using a 1 W radio? Less bandwidth?

Yup ... FM with +- 5 kHz max deviation results in a bandwidth in
the order of 30 kHz ... with the result that the system noise floor
is much lower ... 802.11b's channels are spaced 20 MHz and
the bandwidth of the signal is about 16 MHz ... (there is some

spectrum for guard bands between channels)

You need that kind of bandwidth to get the high data rates, but
the unavoidable result is a higher system noise floor. (No such
thing as a free lunch ... Shannon rules)

> Darn... bis! 8) Now my cluelessness shows! And all that time I tought
> that spread spectrum was only used to prevent frequency jamming and
> severe interference. One of the reason that I didn't want to use spread
> spectrum was not to pollute the frequency space. Is spread spectrum (of
> OFDM) possible on only a few frequencies?

Spread spectrum doesn't "polute the frequency space" ... it
provides some degree of robustness in terms of both rejecting
interference from other sources and being more multipath
tolerant ... OFDM achieves multipath tolerance by sending the
data in parallel on multiple carriers at much lower symbol rates,
thus allowing much larger delay spreads to be tolerated.

> I don't think that this would be possible to emit a 300 W signal,
> espicially on a mobile application...

Whoa there ... if you're talking mobile rather than fixed operation,
you're going to have a host of additional problems ... that would
take a considerable amount of explaination/discussion, but I
would advocate that 2.4 and 5 GHz be used for fixed/portable
operations with directional antennas and the "AP as hub"
architecture ... this will allow some really neat, useful applications
and will not present the MUCH more difficult problems associated
with mobile in motion operations ...

1 Mbps is the lowest (and therefore most robust) data rate supported under 802.11b (which is virtually all of the current 2.4 GHz product available) ...

For lower rates, a custom PHY would be required. Also, the 802.11 MAC might present some problems for lower rates ... but I am more a PHY guy than a MAC guy, so I would have to study the MAC more to give a definitive answer, but I believe there would likely be issues that could prevent the use of off-the-shelf (volume, inexpensive) MAC chips as well.

A channel falling into the Ham bands, is no guarantee
that emissions will not occur outside the Ham bands. It's
merely a center frequency. Do you have an example
product that meets this test? With Analyzer printouts?

> turn off encryption (since we're not
> allowed to use encrypted transmissions), and ID every
> 10 minutes (e.g., send a "ping" packet with your call in it).

You can use encryption. You just can't transmit "...messages
in codes or ciphers intended to obscure the meaning thereof,
except as otherwise provided herein;..."

As long as you publish the password, it isn't obscured, and
it will surely result in a better signal.

My personal opinion, is that this stuff works just fine within
the Part-15 rules, and using it in Part-97 is a waste of good
equipment, because the rules are so restrictive.

When the Proxim Symphony line came out (FHSS), I jumped at the chance to use two of these on a Linux network.

After about 5 years of use, I was completely worn out.

I haven't tried DSSS, but I think there are probably major advantages.

The part that wore me out, was the weather. Wind storms, Ice Storms, Inversions, etc. Every weather phenomina associated with propagation conspired to require my climbing the damn tower, usually when I was the least interested in doing that.

I would recommend that anyone using a directional antenna with this stuff, have a heated radome, and a rope to knock off the ice on the radome :-)

I may do an article on homebrew inflated rubber radomes and heat lamps :-)

>What speeds were you getting with a 16 KHz bandwidth?

This was just ordinary analog narrow band FM (NBFM) handheld
transceivers (HT), so how do you calculate the "speed" for such. The
number of words exchanged during a minute ?

With such narrow bandwidth, there was quite a few multipath signal fades into noise. When the cars were moving quite rapidly, there was about 50-100 fades each second and in fact the speech was more readable than when the car slowed down (and usually ended in a stationary null when the car stopped for a traffic light :-).

In such an environment ordinary 1200 bit/s AFSK AX.25 would have been completely useless. As long as the car was moving, I guess that some protocol with interleaving and ECC could transfer a few kilobits/s in a speech bandwidth, but in order to be able to communicate when the transceiver is stationary, some sort of frequency agility would be required (e.g. frequency hopping) to avoid the multipath null.

The "mask" is pretty tight because of the requirements
in Part 15 to meet out of band emissions requirements
in the adjacent "restricted bands" ... I will endeavour to
take a closer look at this, but my initial reaction is that
we should be OK as long as we keep the TX powers
comparable to what typical 802.11b devices put out.

What would be the point of "using encryption and then
publishing the password?" Don't confuse encryption
with FEC coding ... the encryption coding is just to
obscure meaning and doesn't improve signal quality.

You're talking about content restrictions, it seems ... while
it is true that you can do things under Part 15 that would
be outright illegal under Part 97, I still believe that there are
some really interesting and useful applications under Part 97.

I was thinking more like random data driving the modulator,
but this may be redundant in a DSSS system?? Along
the lines of a scrambler in a K9NG or G3RUH modem.

To get some feeling what those specifications would mean in practice,
it is interesting to compare it to an existing system.

Similar data rates, distances and mobile omnidirectional reception are
typical for DAB (Digital Audio Broadcast), which at least in VHF uses
COFDM and I assume that the L-band DAB system used in Canada is also
using it. You may try to find out the actual transmitter power used
and reliable communication range obtained for such systems.

I think JTIDS at 1 GHz could do this. Works at up to Mach 7 in speed, as well as fixed. It uses a combination of Direct Sequence and Frequency Hopping.

Very Expensive :-)

FA: McKay Dymek AM7 TUNER - AM / Long Wave Tuner.

A AM7 tuner is basically a AM5 with the addition of the Long Wave Band. Used in Europe. That you can receive along the east and west coast of the US. (See Information Below)

Long Wave Information:
"155 to 281 kHz: This is another AM broadcasting band in Europe and parts of Asia. In Europe, there are numerous high powered (1,000,000 watts or more) stations here. These stations are capable of covering an entire European nation like France or Germany with reliable signals around the clock. Although ionospheric propagation is not good at these

frequencies, the high powers used means that many of these broadcasters can be heard along the Atlantic seaboard during the fall and winter. Best reception is usually from local sunset to about 0600 UTC. A few long Wave stations in Asiatic Russia can be heard on the Pacific Coast beginning an hour or so before local sunrise."

A Detroit Michigan user said:
"I have an AM-7 and a DA-7. They make a nice pair together. Unfortunately, there's not too much long Wave possible except on a few winter nights when I can pick up some of the powerhouses from Europe on the AM-7. I have heard Morocco, France, and BBC on longwave here in Detroit. In fact, this winter, I got them pretty regularly"

SPECIFICATIONS:
* Two Band High Fidelity Solid State Tuner
* Frequency Range: 540-1605 kHz. Standard AM broadcast band,150-300 kHz Long Wave
* Sensitivity: 6.0 ,uV for 10 dB signal to noise ratio on Long Wave Band. 3.0 uV for 10 dB signal to noise ratio on Standard AM broadcast band.
* AGC Characteristic: Less than 6 dB output variation for an input level change of 10,uV to 10 mV.
* Bandwidth: -3 dB RF Narrow - 6 kHz; Wide - 15 kHz
* I.F. Rejection: 45 dB
* Audio Frequency Response: -3 dB @ 15 Hz, 7500 Hz
* Audio Whistle Filter: 9 kHz
* Distortion: 1 kHz @ 30% modulation: 0.5% 1 kHz @ 50% modulation - 1.0%, 1 kHz @ 80% modulation - 1.5% (1 mv @ 1 MHz input, wide & distant mode).
* Audio Output: Standard: 1V RMS- 5K output.
* Shipping weight: 12 lbs. (5.5 Kg.)
* Dimensions: 17-1/2" x 10" x 3-1/2" (43cm x 25cm x 9cm)

Features

The McKay Dymek AM 7 TUNER is an all solid state high fidelity AM/Long Wave tuner combining extremely low distortion with excellent sensitivity, selectivity, and a wide audio range. The AM 7 is compatible with professional studio equipment as well as high fidelity "home" sound systems. The low profile black and teak cabinetry makes the AM 7 an attractive addition to any system or decor.

Broadcasters all over the country report excellent results using Dymek Equipment as low cost monitors. As one station executive wrote, after using the Dymek as the standard, "our signal was as close to 'FM on the AM band' as we could get".

reception from local or distant stations is assured by a choice of narrow or wide bandwidth selections at the front panel. To prevent an overload of the "frontend" that may be caused by strong local stations, an attenuator in the antenna circuit has been included. An illuminated, easy-to-read tuning meter aids in ease of tuning and is standard equipment on all Dymek tuners.

Remarkable selectivity is achieved with two eleven element ceramic filters. A whistle filter eliminates most bothersome noise common to AM listening. Distortion is low and sensitivity helps pull in those distant stations; lets you take advantage of AM's natural long range capabilities - hear stations which were previously unlistenable. Wide and narrow bandwidth selectors assure optimum local and distant reception. Illuminated tuning meter.

The Dymek outreach for perfection in AM reception has produced the Am 7. Unlike conventional AM tuners, the AM 7 allows full and accurate reproduction of transmitted program material. For the first time, AM reception is not limited by the receiving equipment The complete transmitted fidelity may now be fully enjoyed and appreciated.

McKay Dymek is the leading producer of AM high fidelity receiving equipment. Authoritative hi fi magazines agree that the quality of AM reception provided by Dymek equipment is truly excellent. This fact is further established by the acceptance of our products by scores of AM broadcasting stations throughout the United States. Many stations use more than one Dymek tuner to monitor and insure their transmitted quality.

For many years very high quality AM transmitters have been operating, but due to the mediocre performance of available AM receiving equipment, most high fidelity experts believed AM reception to be of inherently poor quality.

It is truly a difficult challenge to design and manufacture a tuner capable of high quality AM reception. McKay Dymek engineers accepted this challenge and, after expending great effort, have succeeded in the design of the AM 7.

The McKay Dymek AM 7 tuner is a precision, solid state AM instrument of the highest quality.

Innovations have been engineered to provide:

Very low distortion even at high modulation levels using a unique hot carrier biased diode detector.

Extremely wide frequency response through the use of expensive ceramic filters.

High sensitivity for reception of weak, distant stations.

Once you have listened to AM radio on the AM 7, surely you will agree with our many satisfied customers: the AM 7 is a truly superior addition to any high fidelity system.

RIF SECTION Dual antenna connectors are provided on the rear panel. An

RCA type connector is provided for coaxial cable antenna systems. There is also a set of terminals for direct connection to a longwire antenna and external grounding.

A Dymek AM 7 tuner represents the very best in AM/Long Wave listening. Try it!

Note:This unit needs an external antenna to work I used a terk AM antenna with this unit and it worked well. I am also putting this antenna up for sale. Check for it on ebay. and will need a Long Wave Antenna to receive Long Wave. Like a Mckay Dymek DA7 Antenna or a QUANTUM QX PRO LOOP.

This unit has some minor scratches on the top also a scratch on dial under czech USSR (could be fixed with black paint or marker from the inside) and missing ground plug (see pictures). Otherwise it is in Great Shape!

I accept Paypal, Billpoint & Money Orders. $12.00 for shipping-Continental US only. Insurance optional at buyers expense. Winner to pay within 7 Days of auction close. Email me with questions.

Thank You and Good Luck!!

FA: Terk Advantage AM Antenna

Finally an AM antenna that is truly beautiful!

When appearance is an issue you finally have a great choice! It has most of the power of a Select-A-Tenna plus it is a handsome addition to any decor. It comes with wires like the Select-A-Tenna Hardwire model for direct connection to your stereo or can be used like the regular model Select-A-Tenna. It certainly blows away any of the smaller antennas supplied with a stereo. Size: 9.5� high.

The Terk AM Advantage AM antenna dramatically improves the AM reception from any receiver, tuner or portable radio. Its unique passive wireless technology eliminates the need for connectors, batteries and power cords � simply place the AM Advantage near the receiver or radio.

The AM Advantage combines wireless convenience with advanced tuning technologies such as Terk's exclusive Pin-Dot Pre-Tuning� that zeroes in on even hard-to-get stations by tuning the antenna to the station's frequency.

Features:

* Pin-Dot Pre-Tuning dial adjusts antenna to a specific frequency for best reception of individual stations
* Compact design allows easy placement
* Non-skid base keeps antenna in place during adjustment
* Reception pattern: Omindirectional
* Dimensions: 9.5"H x 9.5" W x 2.5"D
* Wire For Direct connection

AM Advantage Q&A
Does this antenna need power for it to work? Also, how can I connect it to my radio?
The AM Advantage is designed for "wireless operation"--that is, it does not need AC or battery power and will actually provide signal to your radio or receiver without having to be connected with wires. However, if your radio or receiver has connections for an external AM antenna, we supply a wire with the AM Advantage to connect the antenna to the input, should you choose to do so. The solid black wire connects to the terminal on the radio or receiver labled "AM in," while the wire with the white stripe on it connects to the terminal labeled "ground."

Can I extend the wire on my AM Advantage to place it on a windowsill or somewhere away from my receiver?

You can extend the wire with by splicing it with insulated doorbell wire, which is available at any do-it-yourself electronics or hardware store. However, we do not suggest doing this, because the length of the wire is calibrated to correspond with the tuning dial on the AM Advantage. When you extend the wire on the AM Advantage, you also change the resistance of the antenna, which will cause the station indications on the dial to be inorrect.

Why does my antenna work better when I touch it?

When you touch the antenna with your feet on the ground, your body is actually acting as a giant antenna and affecting your AM Advantage's reception. You have to let go of the antenna and move away from it to determine its reception performance.

Can I make the wires on my antenna longer?

No. When you make an AM antenna lead longer, you make it more susceptible to interference. The longer the lead, the more interference you are likely to hear. Also, lengthening the cable will change the impedance of the antenna and degrade reception performance.

Why does the antenna work better when my radio and antenna are next to a window?

Many building materials can affect AM and FM signal reception. Metal, brick and stone between the radio station and the antenna will decrease the strength of the signal. to the antenna. However, glass does not block radio signals, and locating your antenna next to a window allows the antenna to receive a cleaner, stronger signal.

This unit is in good to great shape. It shows some scuffs in the rubber base. and that is all.

I accept Paypal, Billpoint & Money Orders. $9.00 for shipping-Continental US only. Insurance optional at buyers expense. Winner to pay within 7 Days of auctions close. Email me with questions.

Thank You and Good Luck!!

Doug Gavilanes wrote:

> I am having a problem with setting up a Tiny-2 TNC for mobile APRS. I had it all figured out and had the TNC up and running fine, but a couple of days ago, the memory defaulted back to a clean slate in the EEPROM (MYCall was NOCALL, etc.).

I tried to use a Tiny-2 MkII and a generic TNC-2 compatible in a mobile situation.

The devices were very prone to an apparent re-initialisation of the configuration to some cold start values. I could improve both devices by installing brown out protection in the CPU reset area. The brown out protection is to prevent the CPU running when the voltage got too low to be reliable, and both TNCs suffered from that problem when the vehicle engine was cranked. While it improved things, the TNCs would still occasionally cold start.

This indicates to me that the way in which writes to RAM are handled are prone to power loss during the process and are inherently unreliable.

The best answer seemed to burn an EPROM with customised power on defaults.

I asked Paccomm if they had info on the data areas in the EPROM so that I might burn custom cold start values, but they didn't reply (no surprises there). I just put that down to experience like the other problems with the Tiny-2 (incorrectly wired modem disconnect header, charge pump capacitors installed incorrectly).

Bottom line is that the TNC-2 has more capability than required for APRS and common implementation (like the Tiny-2) are not robust. If you must use a TNC-2, find a ROM image that is usable for APRS and that has published cold start data vectors so that you can make sure it cold starts the way you need.

Owen

There is data "whitening" in the 802.11 standards.

Basically, I think that whatever we can legally do as hams
in networking is "interesting and useful"  I don't browse
"hotbabes.com" on the internet, so why would I want/need
to on ham radio?

Commercial content can be filtered ... witness the programs
```

you can download to keep "pop-up ads" from coming up in
your browser.

Carl - wa6vse

I own a Yaesu VX-5R and have managed to get it communicating at 1200bps AFSK using the Linux soundmodem. I am unable to establish 9600bps FSK to a radio in the same building!

Is the VX-5R not 9600bps capable? If anyone has any insight it is much appreciated.

Thanks

Sure there are. I can point to at least five in operation around the local packet network.

regards
Terry

I have recently aquired a A & A Engineering Packet Modem which I am told is supposed to be one of the "baycom" type of packet modems. I cannot seem to get this thing to work and looking for help/tips/suggestions.

I have downloaded quite a few different pieces of software but apparently none of these seem to be the right one for it. I even tried downloading the baycom software but every time I get the download, and open it up it states it is corrupted regardless of source downloaded from. Maybe if I had the right software, this thing would work. The floppy included with this when I bought it, was the prior owners "boot disk" as it appears.

One problem I have noticed for sure is that no matter which PC I attempt to connect the serial cable between the packet modem and the serial port on either the laptop or the home pc, the thing automatically sticks in TX mode. Have also tried this on a few other PC's other than my own two PC's.

Any ideres on this?

Generally, no standard FM rig is 9600bd capable unless it is included as a mod
or a feature.  9.6K operation requires the audio to be taken directly off of
the discriminator circuit.

Nice, my AGWTERMINAl has a hidden future, you can do YAPP with really large frames.
Not too much tested but as i can recall it was working...

1.External tnc2 with NORD<>LINK eprom .It works also with smack kiss
2.My Soundcard modem

As far as I remember there is no way to "agree on frame size" in normal
V2.1.
You just transmit whatever frame size you want. Only the higher layers
include
means for window size etc.

Actually I don't see the point of transmitting longer frames. As we are
still using uncoded transmission I would increase the window size (use
more
pakets eg. the EAX25 thing with modulo 127 addressing instead of just
7),
not the packet size. The likelihood of frame errors is more or less
proportional
to the packet size.

> Actually I don't see the point of transmitting longer frames.

Longer frames on a solid link, transports more data in a
shorter amount of time.

With AX.25 Fragmentation, you don't have the protocol overhead
in every packet. The first packet has the protocol bytes, and
all the rest of the packets have pure data.

For 9600, I found that I could spray 4k bytes in eight packets
of 512 bytes. Using a 1024 MTU and a 984 MSS (MTU - 40)
with a window size of 4096.

This would start off slow, and grow to the whole four MTU
at once, with the other side doing one ack. If any error occurred,
it went back and started with one MTU again.

I think the reason many people didn't try large packets, or see
the point in transmitting them, was that most of the 9600 links
were just as poor as the 1200 baud links.

IIRC, no; it's a very good PC sound card to radio interface intended for HF modes like PSK31. Check out <http://www.sedan.org/>

Unfortunately, TAPR doesn't own (or even possess) the TNC-2 source and isn't
allowed to release it. We have a license to distribute binary code versions
only. My understanding is that the code base is still being used (and
modified) for commercial data applications, so it's unlikely that the author
would be willing to release the source.

Only the TCP/IP protocol overhead. Or whatever protocol you use on top of AX.25.

The AX.25 protocol overhead is included in every packet, also with AX.25 fragmentation. That only serves to transport larger PDU's in a limited packet length, not to cut overhead.

Combined with extended sequence numbers this indeed may be a good option (as it keeps the unit of corruption small, and can use selective retransmission to recover a lost frame that is a member of a larger PDU)

Rob

Hi,

Just wondering if anyone's gotten a baycom type (ie tigertronics Baypac) modem to run under Windows 3.1 using AGW - specifically, I'm intersted in using APRS for Windows 3.1, but can't figure out a way to get it to run

with my baypac (I haven't tried AGW, but it says it's only for windows
95/98) - will the win 32s drivers help? I've done it with windows 98...

Any help would be appreciated,
Sam

AGWPE is for 32 bit Windows, so there's no way you're going to get it to work with Win31.

The following will work, but if you've never used BPQ before, it's very much a case of jumping in the deep end, when you can't swim, without a rubber ring!

1. Get a copy of BPQ 4.08a. You can find it at - http://www.ui-view.com/winpack/bpq408a.zip

2. Get a copy of my NODE2BAY driver (that uses G7JJF's BAYDRV.VXD) - http://www.ui-view.com/winpack/nodbay13.zip

3. Set up BPQ to use the NODE2BAY driver. This is the hard bit, and all I can say is -

(a) Read all the docs.

(b) Find someone to help you, but that won't be me - I just don't have the time available.

4. If/when you've got BPQ and NODE2BAY working, download the 16 bit version of UI-View from http://www.ui-view.com and, in "Comms Setup", configure it to use BPQ.

5. If you've got this far, then you're using an APRS compatible app, in Win31, with your BayPac modem!

Thanks John, that's useful information.

Rob and I have both started (and stopped and maybe started again)
projects to create an "application loader" eprom for the TNC2.

I think Rob is still working on that project. My eprom programmer
died, and since there are no other proms I need to program, kinda
put things on hold :-)

There was discuion of using XID frames, but the wording in the paper
was something like "between cooperating stations". To me this implied
the sysops would talk on the LL and decide what frame size to run :-)

> You just transmit whatever frame size you want. Only the higher layers

Yes.

> to the packet size.

I ran a few tests (> 2MB of data) on my "bad" 9600 baud link with frame
size 256 and 556. The retry rate was about the same. This link tends to

```
drop out for 5-30 seconds, about every 2 to 5 minutes. i.e. there is a burst
of errors, then none for a fairly long time. Running some tests with 128 octet
frames now, see the same retry rate. So smaller frames, segment at L2,
use large window appears to be the best choice.

I've begun coding this.
May take awhile to finish, too little free time right now :-(

It appears to be a clean channel with only some Rayleigh fading due to varying multipath due to varying tropospheric conditions, ie. the frame gets corrupted when the signal level drops below the threshold level of the detector, which often happens quite regularly for a specific path on a specific day and a specific frequency.

Doing the same test on a different day or a different frequency band would have a different fadeout rate. If the fadeout cycle is faster than the frame time, no data can be transferred with such simple protocols as AX.25. When the frame time is reduced, the throughput will increase as long as the frame time is longer than the fadeout time. However, when the frame time is well below the fadeout time, the performance limit has been reached and is

nominal_rate * (fade_cycle_time-dropout_time) / fade_cycle_time

With 128, 256 and 556 byte frames at 9600 bit/s, the frame times are about 180, 300 and 600 ms respectively, thus, the frame time is well below the 5 to 30 s fadeout periods, when the signal is below the threshold.

However, if the data rate was 1200 bit/s, the frame times would be about 1.5, 2.5 and 5 s respectively and thus are comparable to the shortest fadeout times and the long frames will suffer a performance degration.

The above assumes Rayleigh fades due to slow tropospheric variations and no other signal degradation mechanisms on the channel. However, if there are other propagation mechanisms, such as airplane reflections (airplane flutter) or reflections from moving cars on a nearby road, the fadeout rate is much faster and consequently a shorter frame must be used, if such simplistic protocols as AX.25 are used.

After some backtalk it seems the only viable solution with the TAPR software is for the original author to include this functionality in a new revision of the firmware. Of course this would be not really trivial, as you need:

- some memory management tricks that allow reservation of a block of memory at a predictable address (i.e. not a "malloc" type of allocation but more like cutting a block of memory at the top or bottom of available RAM)

- some loader that allows downloading of code (e.g. in INTEL HEX format) over the serial line into that block of memory

- the availability of API functions via a fixed calling location (jumptable, use of RST instruction(s), whatever)

and most important (and probably requiring the most effort):

- documentation of the above, including specification of the rules that a downloaded application has to live by

After thinking some more about it (and my specific application) I now tend to believe that a "lightweight" firmware like K3MC's KISS code, modified to have an API that allows send and receive of HDLC frames and async characters, and to include the firmware downloader, is probably the most viable solution for now. I can just publish the source code with commented function entry points as a form of documentation, and I don't need the docs for my own project anyway.

The disadvantage is that the functionality above HDLC frames would have to be in the application, but it looks like my app can do with only UI frame exchanges so that is not too bad. AX.25 connected mode would be a bit more of a drag, but of course subroutines to handle that could be put in the firmware when required.
All the "user interface crap" is not going to be needed anyway...

Rob

Hi,

I would like to use WinRadio or something like it for processing
digital signals. I would like to get an IF output (ideally digitized)
that I can then do signal processing on.

What are the output options on WinRadio? Can you get IF output? If
not, can you get discriminator output? Or, are you limited to audio
output?

Thanks,
John

Exactly, plus some aircraft scatter from time to time.
We could get more margin by increasing power level.
Obstructions (mountain ridges) at three points along the path.
The large window / small frame solution should be good here.
Will find out once I finish the code.

No restriction on protocol for some of my links (point to point).
Restriction is to use existing gear (KPC-9612 or Data Engine).

I have several other links that show different propagation effects.

One is about 100 km., passes over the city of Portland near mid-path,
has serious scatter from several mountains, sees the airport approach
paths ... and still works very well almost all the time :-) There are no
obstructions, i.e. I can see the other end of the path with a telescope.

Another is 40 km. (my shortest linkd usually shows a retry
rate near zero. When it rises to 5% we know we have equipment
problems.

I've dabbled with RTTY and other digital modes off and on for the past 30 or so years.

Recently I downloaded a freeware program (Hamscope) for use with a soundcard.

I'm glad to see that one of the problems have been solved, and that is tuning. With the waterfall and/or spectrum display (not to mention AFC!) it sure is a heck of a lot easier to tune in a RTTY signal than it was 30 years ago. (Of course my Kenwood is a lot nicer than that Collins boatanchor our club had back then.)

One question remains... Ok, lets say I have the signal tuned so that the mark and space frequencies are identified, but how do I know what format the station is using? and what is the baud rate? What are the most common formats that I should try first? Is it 5, 6, 7, or 8 bits?

I am talking about both amateur and commercial. Eventually I would like to operating RTTY and PSK31, but I also want to look in on what the commercial guys are up to.

My old PK-232 had a SIAM (Signal Analysis Mode) that would
attempt to analyze signals and determine such things.

I'd also be interested in a sound card program to do that
type of analysis (and more).

Most all amateur operation is 5-bit baudot code using 170 Hz shift at 45.5 baud (60 WPM). You may find a very few hams using 7-bit ascii code and a few running baudot at 100 wpm (75 baud).

You will find very few if any commercial stations that you can copy because they use encryption (except perhaps a few Wx stations). I think they are still running 850 Hz shift, 5-bit baudot code at 60 WPM.

I was thinking of that idea myself, a long time ago, using a good ol' TU for the demodulation. I don't think it would be that difficult. You could use an FFT to get the baud rate, but that could also be done with by just measuring the duration of the mark and space. Whatever comes out smallest will be pretty close to 1/baud. Then the number of bits would have to be done by trial and error to minimize the framing errors. All this would be relatively easy in C++, I think, but is there something out there that does it already?

[snipped]

Most of the hams are using 170 hz or maybe a few at 200 hz shift. Use 5 bit Baudot code and 1.5 stop bits. Set for 60 wpm or about 45.5 baud. Usually if you set your receiver to lsb and have the mark tone at the lower frequency and the space tone at the higher frequency. The comercial stuff seemes to use the oposit so you just tune it in the same way but use usb.

Search for the hamcom program. I think this is the one that uses a simple IC circuit instead of a complicated demodulator or sound card. It has a setting where you can see the actual bits and can freeze them on the computer screen.

You may also want to try the MMTTY sound card program.
The stuff must have improved in the 10 years from your time to mine. I used a homebuilt st-6 and did not have any problems tuning in with the meter or a scope hooked to it .

Hi:
Hamscope is a nice program, but the problem with commercial RTTY is that they are encrypted or are using oddball coding. The bottom line is there is very little commercial RTTY that is printable.

I'm on a very small budget and want to try out Airmail. There's an Airmail
host station within 40 miles of me, so I'm hoping that Pactor I will be good
enough to get me going. Any really -cheap- solutions? I've got a
relatively new notebook computer and an Icom 706 mk II. Tnx in advance,

Paul

The cheapest way is probably to find a good used TNC that includes
Pactor. You won't find any Windows programs that will make a Pactor
ARQ link using the sound card.

You can find used PK-232MBXs fairly cheaply. Just make sure that the one
you buy has the Pactor firmware upgrade.

```
Or, perhaps an older Kantronics KAM.

My WinRadio (the 1000e I think -- can't remember exactly, but it was the
current one at Hamvention last year) has a discriminator output that works in
the narrow FM mode. There's no direct IF tap.

I am looking for a used, but working Pac-Comm TNC for APRS use (1994 or
newer firmware release 5.0). What do you have (and how much do you
want)? Please reply via e-mail so that it doesn't get ugly here (3rd
party traffic, you know?). Thanks in advance.

That web site doesn't seem to be accessible to the outside world.
I would expect that you would have to re-package the Tekk in order
to survive your launch vibration environment. Have noticed that most
of the university satellite projects seem to ignore the radiation
environment in space. Are you taking any special precautions in

that regard?

Normally they specify 1-3 month life expectancies and low orbits.
The radiation isn't that important in that case.

Rob

What's the meaning of this Hmmmm? 8)
Anyway, let me explain more how I see it:
The Cirrus Logic CS22250 looks like a bridge controller between a
10baseT (802.3) network and a Wireless Network (802.11), it's pretty
hard to tell since no datasheet is avaiable on their web site. If I
understand their description correctly, on the LAN side, you need to use
a 10baseT controller (like the CS8900A). On the Digital Radio PHY side,
I wanted to put some kind of modem or adapter to connect it to a normal
HAM radio. Since I don't have a datasheet, it's pretty hard to tell if
it would work...

Ref:
CS22250: http://www.cirrus.com/design/products/overview/detail.cfm?d=277

I'm not sure if I get your point here (especially the OS/2 stuff), but
I'll try an answer. The beauty of digital signals is that you can
reconstruct the signal rather than just amplify the signal+noise like
you do with analog signals. To prevent line loss, you should use the
digital signal for as long as possible and convert it to analog (with
the CS22250 for example) just next to the antenna.

>
> Or am I all wrong here?

The CS22250 has a 10baseT connector, so anything that can speak 10baseT
can use this wireless bridge.

Not sure if that's what you asked for, but I still hope this helps, 8)

Darn... 8(I'm pretty surprised that it takes that much power to send in
omni. Excuse my cluelessness, but how come amateurs communicate in the
800 MHz band with a repeater located at 20 km without line of sight
using a 1 W radio? Less bandwidth?

No, I'm talking about ground to ground communications.

Darn... bis! 8) Now my cluelessness shows! And all that time I tought
that spread spectrum was only used to prevent frequency jamming and
severe interference. One of the reason that I didn't want to use spread
spectrum was not to pollute the frequency space. Is spread spectrum (of
OFDM) possible on only a few frequencies?

I don't think that this would be possible to emit a 300 W signal,
espicially on a mobile application...

The noise density (the noise power in a 1 Hz bandwidth) is usually constant for a frequency band and a particular receiver. The total noise power is directly proportional to bandwidth. Since you want a positive signal to noise ratio, in order to be able to extract some actual data from the receiver, the received signal power must also be proportional to the bandwidth and hence, the transmitted power must be proportional to bandwidth.

In an ideal line of sight condition, the received power is proportional to the inverse square of distance. When communicating within a city at street level, the received power proportional to about the inverse third or fourth power of distance.

If we assume that the receiver bandwidth for the 1 W phone radio is 10 kHz and the receiver bandwidth (after despreading) is 10 MHz for the IEEE 802.11b WLAN, thus 1000 times more power would be required for the same signal to noise ratio.

Assuming LOS, going from 20 km to 30 km the transmitter power must be multiplied by 2.25, thus comparing to this 1 W phone radio 20 km example, the required transmitter power would be 1W * 1000 * 2.25 = 2250 W, which is a bit more than the 300 W that I initially estimated:-).

>> In communications between two stations on the ground, there is a huge amount of interference due to multipath propagation. For any higher data rates, some forms of spread spectrum or multicarrier (OFDM) is definitely required, in addition to the normal bit interleaving and ECC.

One of the reason that I didn't want to use spread spectrum was not to pollute the frequency space. Is spread spectrum (of OFDM) possible on only a few frequencies?

The multipath cancellation is very frequency selective (actually wavelength selective), thus it is important that sufficient amount of signal power is outside of these nulls in order to be able to reconstruct the signal using interleaving and ECC. Note that in practice, the path length will constantly vary, thus the multipath nulls jump around.

What is the name of the start file? If it is a text file you may be able to modify it to point to your C drive. Or there could be an .ini file that can be changed. Has to be a way.

For sale: Paccomm 56K WA4DSY "GRAPES" modem + cable
for PI/2 card. In excellent condition. $275 shipped to lower 48
states.

Also Microwave Modules 10 meter to 222 transverter used with above
items + cables. In excellent condition. Includes extra crystal for
use on 218-219 MHz fixed link band segment. $150 shipped with
purchase of GRAPES modem; will not sell separately until modem is
sold.

Call Jim at 716-381-3102 (evenings before 9 PM) or 716-231-2417 (work)
or email to ZZZjim_cronin@juno.comZZZ
(remove ZZZ on front and back to reply.)

73,
Jim

But the s/n ratio can probably be less for QPSK than would be comfortable
for voice, so your estimate wasn't that bad.

I very much doubt that a 1 W HT 20 km from a repeater would have a clean LOS (above first Fresnel zone) path, so the practical loss is larger than the free space attenuation.

Anyway, the difference between 300 W and 2250 W is less than 10 dB, which in many cases is used as the fade margin to get even some kind of reliability in varying tropospheric conditions. The rule of thumb is that if the reliability requirement is 90%, 99%, 99,9% or 99.99%, the fade margin has to be increased each time by 10 dB (multiply the transmitter power by 10).

If 99% reliability is sufficient for a single hop connection, the end to end connection reliability is only 95% if 5 hops are required, thus, the reliability of individual hops must be improved if multiple hops are used.

If IEEE802.11b based technology is going to be used on ham bands, I can only think of point to point links with directional antennas (on one or) both ends of the link to reach from one ham to an other ham. Still it is a good idea to allow for a 10-20 dB fade margin above the free space loss figures, even if there appears to be a LOS path.

Hi,
I am looking for a practical approach of modulation recognition of a
signal using its frequency spectrum. I need a practical approach but
any help in theoretical areas will be welcomed too.
Bests,
John

I am attempting to use the Pk900 and PaKet62 for both vhf and hf
packet. However, I am not able to cause the streams to switch between
vhf and hf. In other words, the default is vhf, I cannot make it
switch to the hf stream. All the options appear to be right in the tnc
and PaKet. I have also tried a KAM on it, and it won't switch either.I
can switch the streams to monitor packets via the keyboard.

If I use a small terminal programm called Packcom, the stream switch
works just like the book says. I have a feeling I can't see the
forest for the trees and have missed some small detail. Has any body
got an idea of what Iam missing here or what I should look at?

Thanks

Doug VE5DA

John,

If you are not too particular about algorithms based only on frequency spectrum, the following paper has a couple of algorithms using neural networks. The same authors also have a book on the subject (See the references). Hope this helps..

A. K. Nandi and E. E. Azzouz, "Algorithms for Automatic Modulation Recognition of Communication Signals," IEEE Trans. on Communications, vol 46, pp 431-436 April 1998.

Jitendra

Louis,

Take and copy the whole CD to a directory on the hard drive, then install the program from that directory. Should work.

Ha ok! Thanks a lot for the infos, Paul. I'll go to sleep a bit smarter
tonight! 8)

So, considering what you just told me, more realistic specifications
would be:
Freq range: UHF (around 800-900 MHz - in the ham radio freqs)
Data rate: 2 Mbps
Range: 10 km (omnidirectional, more if directional)

Because of the reduced range, the required power would be at least 9
times less than at 30 km. I reduced the rata rate since I discovered
that the original IEEE802.11 was 2 Mbps, so it would be likely to use
this. The estimates drops down to 300W/9 * 2/3 = 22W. This is still 10
times more than I initially wanted, but at least this is legal. One of
my main goal with was mobile operations, and 22W is a lot of power to
get from a battery. 8(Any suggestion on how I could reduce the power
needed?

Meanwhile I followed Bascombe Wilson's (WOAIR) advise and retook a look at Green Bay Professional Packet Radio web site and found some interesting hacks to make to existing IEEE802.11 equipment. One hack that is really interesting is the 2.4 GHz to 900 MHz transverter (http://www.qsl.net/n9zia/2400-to-900.html), with proper amplification that could do what I'm looking for. Of course this project is untested... 8(

Using the 900 MHz bands I could do spread sprectrum in the 2nd class HAM frequencies in that band (902 - 928 MHz in Americas: http://www.rac.ca/902MHz.htm).

Thanks and 73,
GFK's

Those calculations apply for line of sight conditions.

>One of
>my main goal with was mobile operations, and 22W is a lot of power to
>get from a battery. 8(Any suggestion on how I could reduce the power
>needed?

Unless you live on a perfectly flat plane or are driving on a frozen lake, I do not see how you could get a 10 km line of sight path !!

The attenuation for other paths is (much) greater. My experience with HTs on 1.3GHz in a varying terrain, with the other station more than 100 m AGL, is that a usable connection can be maintained to about 10 km with occasional spots over 20 km. However, the bandwidth was only 16 kHz, so scaling up to a more than 1 MHz bandwidth, we are talking about power levels around 100 W.

Unless you are planning to send live video from the mobile, why do you need 2 Mbit/s to/from a moving mobile ?

Anyone running PACLEN 312 with AX.25 L2V2.1 using KISS?
If so, any problems with specific TNC KISS implementations?

Most TNC code is mechanized as a queue of fixed 256 byte length. So I would assume the only problem would be using two queue entries for each packet, but there's probably enough for operation at low baud rates.

Thanks for the info.

Sorry, perhaps I did not give quite enough information.
The situation of interest is direct connects, thus no digipeaters involved.

The sources I've seen have buffers long enough to handle 312 octets,
as long as there are no digipeaters :-) Might be different in other
TNCS, or other versions of firmware. I'm guessing that no TNC
uses mbufs for the KISS implementation, thus the query.

Have only tested with KPC-9612 to date, since that's what is on both
ends of the link I use for testing. Works fine. For IP, with fragmentation
at the AX.25 layer, and 312 octet frames, one gets a bit of improvement
in throughput. Since it's KISS, the frames don't hang around in the TNC

for very long :-)

Will test with a few other TNCs and see what happens.

I have been successfully using a 400Mhz laptop with a 756Pro for PSK31 for some time. Recently I tried replacing the laptop with a Sony Vaio 1Ghz desktop using a Yamaha AC-XG WDM sound card. When the rig is hooked up to the Vaio the TX frequency is always higher than the RX frequency, IE: if I reply to a station that has called CQ on the frequency that he was calling on for him to hear me he has to use his RIT and tune up in frequency. I have swapped out radios, simulated the problem at home using the Vaio on one radio and the laptop on another radio, tried using different software (Digipan, MixW. DX4Win) made sure TX was locked to RX and cannot figure out how to rectify it. If anyone has any hints or suggestions they would be very much appreciated.

Thanks es 73

Richard / N1VX

rec.radio.amateur.misc:26904 rec.radio.amateur.equipment:26661

I am having a problem with setting up a Tiny-2 TNC for mobile APRS. I had it all figured out and had the TNC up and running fine, but a couple of days ago, the memory defaulted back to a clean slate in the EEPROM (MYCall was NOCALL, etc.).

Findu.com shows my data string as:

Report received 2 days 4 hours 41 minutes 33 seconds ago

```
         Raw packet:
N6XQY-12>GPSLJ,RELAY*,WIDE3-2:$GPGGA,005241.31,3351.5928,N,11817.7613,W,1,08,1.0,0
0028,M,,,,*3F
```

I tried to use my limited notes since the TNC crash, but unfortunately

I'm still down. The data below is how the TNC is set up right now. Can someone here please have a look at my settings and point out where I am set incorrectly? Thanks in advance.

TNX es 73,

Doug Gavilanes, N6XQY
Garden Grove, CA.

Hi

> Anyone running PACLEN 312 with AX.25 L2V2.1 using KISS?

AX.25 L2V2.1 specifies that maximum datalen is 255 bytes.

If you are using a higher value then you are not in AX.25 L2V2.1, but something yours!!!

As for the kiss mode, there is no problem with frame len. I am using for tcpip 2000bytes which fast enough.

The V2.1 specification says that frames larger than 256 bytes of
information field my be used by any connection where the two ends
agree on the larger frame size. See the 7th computer networking
conference paper and the follow up papers on the topic.

Which TNCs?

What I'm trying to verify is which specific versions of firmware in
which TNCs have been tested.

The original K3MC kiss code, and thus all TNC's that use it directly or
embedded as separate kiss operational mode, has dynamic buffers without an
implicit maximum size for a frame.

Your sound card is a bit out of calibration, so is mine.

On my current sound card, I have to keep the rit on the radio set +12 hz to keep it from walking around the band.

I found this value by turning off the "tx tracks rx" option, and calling cq. then once I was answered I slowly moved the radios rit, until the PSK31 display showed that the rx value I was adjusting and the tx value which I had "set" were the same (1,000). So now I just set rit to 12 htz to start with.

True. But it should be a multiple of 124 bytes as each queue node
overhead is four bytes, and one byte of storage results in 128 bytes
of queue, so be smart:

```
struct queue {
    unsigned int next;                /* NULL for end of queue */
    unsigned char n_bytes;        /* number of bytes in this buffer */
    unsigned char n_read;         /* number of bytes read from buffer */
    unsigned char data[124];     /* buffer */
};
```

312 bytes = 124 + 124 + 64 + (60 bytes fluff). Not that these 60 bytes
get transmitted or anything, it's just 60 bytes going to waste.

Source Code Follows:

```
;
; The buffer list is kept from "bottom" to the end of RAM.  The format of
the
; buffers is:

So this would include the original TNC2 and clones, I would guess.

```

That's the original TNC2 code AFAIR.

I've seen one implementation that used 60 byte buffer fragments (plus four byte buffer chaining overhead). There are probably others.

For all implementations of that type, max frame size would only be limited by the size of the available buffer pool :-)

I'm still curious though: has anyone tested various TNCs to verify their actual behavior? I'm only able to test Kantronics at the moment, since the link used for testing has a KPC-9612 at one end, and a Data Engine at the other. I am guessing the Kantronics TNCs probably do not use Mike's original KISS code. Well, perhaps the Data Engine might :-)

Will run further tests this evening.

>So this would include the original TNC2 and clones, I would guess.

The original TNC2 had no KISS mode.

The K3MC code was written to overcome this, and later TAPR code (1.1.6) included a KISS mode that seems to be just a branch to the K3MC code as a separate operational mode (i.e. it just jumps to the K3MC code that takes over the entire TNC).

From the doc:

KISS ON|OFF   default: OFF

This command is used to enter the "KISS" mode for operation with various experimental protocols. KISS is used with intelligent host computers. The most popular use has been in conjunction with the KA9Q TCP/IP networking software, available from TAPR and elsewhere.

To operate KISS with this release, enter the command KISS ON, then the command RESTART (NOT RESET!). The CON and STA LEDs will flash three times when initially actiated.

This flashing of the LEDs is just what K3MC's startupcode was doing as well! I don't have TAPR source code to really check it.

In the AEA TNCs it is not done like that. The KISS is built on top of the existing HDLC driver, which has a fixed buffer (probably 312 bytes). So the AEA KISS mode cannot handle large frames.

Correct of course. K3MC KISS EPROM could be subsituted.

The Tasco uTNC21 has the same code in 1.1.6, have one here so can
test with it. Also have an older TNC2 clone ... and an early KISS prom for it.

Also have a TNC1 with KISS prom in it ... guess I could test with that also :-)

I may have it here somewhere ... not sure exactly which versions
are still lurking somewhere on my file server. Howie might be able
to comment on this issue also.

That's good information, thank you.

I'm also considering an implementation of the "large window" code.
Finally have a few stations that are direct connect and interested
in testing new ideas ... they are running SNOS ... so now I can
test some of your interesting ideas.

Is source code for the TAPR firmware available anywhere?
(I mean the source for the 1.1.x series of firmware eproms)

That "add a downloadable application" project is still on the desk... I
now have the hardware complete (tcvr, tnc, gps) but still need to code the
necessary firmware for it.

The large window mode has been in Linux AX.25 for a long time. It is being used by Linux users, I think. Of course Linux AX.25 is broken, and the people who have the right ideas (and a first take) for improving it have stepped out. Too bad.

I'm not so sure if using a large window along with KISS TNCs is a good plan. You could easily run into flow control problems. Make sure the maxframe is not set too high (don't set it to 63) and do something to reduce the maxframe dynamically when more than one session is active.

Of course, a slow-start is mandatory. Don't send MAXFRAME frames on the first transmission after receiving UA. Start with one or two, and increase (e.g.: double) the dynamic maxframe with each ACK that you receive that bears the expected sequence number. Cut back when a REJect or an ack for an old frame is received. Together with a store of correctly received out-of-sequence (furture sequence number) frames at the receive side this serves as a selective reject mechanism, and is also really required to keep things stable. Especially when a dumb, buffering device like a KISS TNC is present in the link.

I don't have numbers, but two of us set up a 10 mile link with PackeTwin cards, and at 9600 we ran 1024 MTU 984 MSS and Ax.25 Fragmenting. It was neat to watch the packets get sprayed, and one ack. I had dreams of a couple more 10 mile hops, to get through the town, but by then all the real Hams were dying off, and the new Hams don't do club meetings, or technical lunches. Thus, X-1J was put up, and then KPC-3 THENET clones took their place. NOS died off...

Then we tried it on a DRSI DPK-2 link through the serial ports (DPK-2 is a TNC-2 clone). Overall throughput was much lower.

The PackeTwin solution actually replaced the phone line UUCP between our Unix boxes! It was that good.

Well, I live next to the St-Laurence River which is about 3 km wide, so in diagonal one could get 10 km, but I admit that this is a bit far fetched. 8)

>
> The attenuation for other paths is (much) greater. My experience with HTs on 1.3GHz in a varying terrain, with the other station more than 100 m AGL, is that a usable connection can be maintained to about 10 km with occasional spots over 20 km. However, the bandwidth was only 16 kHz, so scaling up to a more than 1 MHz bandwidth, we are talking about power levels around 100 W.

What speeds were you getting with a 16 KHz bandwidth?

> Unless you are planning to send live video from the mobile, why do you need 2 Mbit/s to/from a moving mobile ?

I'm more of a computer guy than an electronics guy, and my moto as always been the more bandwidth, the better; but I'm realising that there's no "magical" bandwidth, especially in radio. My idea is that the more bandwidth that you have, the more possibilities of applications.

You question made me taught of possible application, what I hadn't done before. Here's what I can certainly see using this: Emergency rescue operations, festivals and normal Internet access for the Hams. For emergency rescue and festivals, I guess you only need email and web with some images, so I guess 50 Kbps would be enough. But for normal Internet access, especially surfing the web, you need more bandwidth to enjoy your surfing, let say 100 Kbps. If there are many users, you need to multiply by the number of users, let say 10, which make 1Mbps.

I guess you're right, 2Mbps is not really needed. 1Mbps for a fixed station and 100Kbps for mobile stations would be more resonnable. I don't know if it's possible to use IEEE802.11 at such low speeds. I really would want to use it, since it has some real interesting features such as ad hoc networks, being OS and protocol independant and there's a lot a chips available that support it.

Jitendra,

Thank you for your answer. I need just a practical approach, depending
on frequency or even time domain charactristics. It is not important
if it is automatic or not, but I need to discover the modulation type
of a given signal. At present I don't have access to the book but I
have the paper. Although I have not read it completely but I think it
is not so practical. Any way, thank you very much for your help.

John

I've not run across any place to get a legal copy of the sources.
I have some old sources (perhaps 1.1.2?) from about 1985.
Had those because I helped out a little bit with some flow
control vs. UART issues. Have not seen anything newer, and
cannot release the old sources without permission from TAPR.

Mine is still on hold. Do not want to spend the $$ for a new EPROM
programmer :-)

The situation of interest here is all point-to-point links, so can test with a very simple situation :-) Some other things to finish first, then will look at the large window capability next. Large frame size is not a good idea on one of the links. It is 9600, obstructed, about 50 km, so retry rate is higher than we would like, even with 17 el yagis to reduce side reflections. This case would benefit from large window and selective reject.

> Of course, a slow-start is mandatory. Don't send MAXFRAME frames on the first transmission after receiving UA. Start with one or two, and increase (e.g.: double) the dynamic maxframe with each ACK that you receive that bears the expected sequence number. Cut back when a REJect or an ack for an old frame is received. Together with a store of correctly received out-of-sequence (furture sequence number) frames at the receive side this serves as a selective reject mechanism, and is also really required to keep things stable. Especially when a dumb, buffering device like a KISS TNC is present in the link.

Makes good sense. Already have dynamic frack in the code, which works very well. Should add dynamic maxframe also, not too hard.

Just starting tests with large frame size across the "not so good" path, will take a few days to collect statistics on how well it works.

Thanks for all your comments.

Also interesting information, thank you.

We have a few folks here who have recently become interested
in tcp/ip, and are willing to play around with new ideas. Gives
me a testbed for some of this stuff :-)

Hank,
The only KISS ROM for the VADCG TNC+ handles arbitrarily large frames without difficulty. :)

regards
Terry

More good information :-)
Wonder if there are still any VADCG TNCs on air?

> First, here's a summary of the two present IEEE802.11 options:
>
> IEEE 802.11b (the most common)
> Freq range: 2.4 GHz
> Data rate: Up to 11 Mbps
> Range: 100 meters (omnidirectional)

MUCH longer ranges achievable with directional antenna.
Consider the Access Point as a "hub" and the user
terminals with antennas pointing at it ... also, if you can
settle for, say 2 Mbps (the system will automatically
"throttle back" to more robust modulations if it can't
maintain link quality at 11 Mbps ...) you can go much

further.

The AP would be analogous to the old packet radio BBS/digipeater/NETROM node.

As a ham, an engineer who works for a world leader in 802.11 wireless LAN products, and someone who is involved with 802.11 standards development, this is the approach I would recommend (and have been advocating here ...)

The "clear path" range (like to a decently sited "hub" AP) can easily be 18+ miles at 11 Mbps ... more at the lower data rates, which would still be VERY competitive with DSL or Cable Modem performance.
(note that this is based on the ~+15 dBm TX output that standard off the shelf PCMCIA "client" cards produce)

I would recommend against going for greatly increased range with increased power ... if you need a point-point link with longer range, more antenna gain is the way to go ... it will be more spectrally efficient from a systems engineering and frequency reuse standpoint ...)

Bottom line ... inexpensive off the shelf gear is usable "as is."   All that is necessary is to select (in the setup software that comes with such devices) a channel that falls in the ham band, turn off encryption (since we're not allowed to use encrypted transmissions), and ID every 10 minutes (e.g., send a "ping" packet with your call in it).

> IEEE 802.11a
> Freq range: 5 GHz
> Data rate: Up to 54 Mbps
> Range: 50 meters (omnidirectional)
>

Again, range can be increased with directional antennas, using the "AP as hub" paradigm ... however, at the moment, 802.11a products are new to market, there is less competition, and prices are higher. Also, propagation loss is higher at 5 GHz than at 2.4 GHz, though that can be overcome with antenna gain ...

For the present, I would start with 802.11b and grow into 802.11a as it matures over the next few years. Most manfacturers will be producting dual-band cards and APs by that time, which will allow a transparent transition to dual-band hybrid networks.

> What I'm looking for is something like:
> Freq range: UHF (around 800 MHz - in the ham radio freqs)
> Data rate: 3 Mbps (or whatever we can acheive)

> Range: 30 km (omnidirectional)

The 902-928 MHz band could be used, but the cost of gear would likely be higher, due to the lack of economies of scale (ham market much smaller than commercial WLAN market). Cost is a big factor in adoption (we hams have a reputation for being "frugal") ...

Additionally, the available bandwidth in the 902-928 MHz band would force you to accept lower data rates in order to have more than 1 channel and there is more competition from cordless phones, baby monitors, and all sorts of other things, not to mention the present amateur uses there.

> We could use existing 802.11b controllers (like Cirrus Logic's CS22250) and we would only need to make our own Digital Radio PHY. I guess it would be best to make an adapter between standard HAM rig and the 802.11b controller.
>
> Standard 802.11b uses the unlicensed 2.4 GHz band and must use Spread Spectrum (DSSS and FHSS) to cope with interferences caused by other devices using these unlicensed frequencies. This is different in a HAM radio situation, since:
> 1) there should not be much interference (we'd use HAM licenced bands)

The 2.4 GHz ham band is a subset of the 2.4-2.4835 GHz ISM band.

> 2) we can legally emit a much stronger signal. I beleive that standard IEEE802.11b emits a 100mW signal, we could use 2W or more depending on the situation.

As I pointed out above, I don't believe it is necessary to use more power than most 802.11b devices put out ... antenna gain and good system design are the key to achieving desirable performance.

> Because of this, I guess it would be preferable to modulate the signal on one frequency (no spread spectrum).

Again, you are talking about reinventing a wheel that industry has spend bazillons of dollars inventing, optimizing, and cost-reducing, and which is completely usable by hams "as is." To reinvent this wheel will IMHO is not the best approach, since it will result in the inability to leverage that existing technology with the result that a "ham-specific" design will be more costly.

I think this is a case where "adopt" is a FAR more sensible and cost-effective approach than "re-invent."

Hi;
Can anyone tell me where I can download a copy of AEA FaxIII ? I have it on 3 5-1/4 disks but figured it would be easier to download than to try and find an old 5-1/4 drive.

Try Timewave - they took over the remains of AEA, including FAX III.

I have a Packet controller board for IBM or compatible PC.   This is an AEA PCB-88 complete packet TNC [works both VHF-UHF and HF]. It comes with the internal packet controller board, cables, power supply [not really needed] and PC-Packratt-88 program [works in DOS or Windows]. Works fine but only does Packet. Asking $75 + something for shipping [the manual is heavy]. Contact Les via: e-mail kbtgw@ws.quik.com or telephone at 516-295-0696.

I am looking for manual or a copy of manual for aea pk-96.
Does somebody know if this can be found on the internet?
Or if somebody of you has this manual, maybe you could make
a copy of it and post it to me, i will pay the post & printing costs.

Best 73's Timo

Anyone have any experience using one of these? I figured out how to hook a tnc into the serial port on the bottom - that was simple enough and I can use it as a dumb terminal. Just curious on how hard it would be to port a tcp/ip stack to it?

Also - what is the legality of actually using the internet over an ax25 connection? are you allowed to use rsa for the password session?

Thanks :)

I think it has a tcp/ip stack as a standard item.

I have a friend who runs Linux on his ipaq. He also uses a 802.11b

wireless lan card wiiith it. So I am sure he has an TCP/IP stack
running on it to.

I know it has a tcp/ip stack - I was wondering though what you could do with
it and packet radio :(. Wouldn't you need an ax25 driver?

Hi all

At iLink's webpage the conference server is coming soon for download
(and has bee quite a while), although more conference servers have
became online to ilink network lately.
Is there some other site to download the conference server or is it
possible to run a third-party software as ilink conference?

We would be really interrested to run our own finnish conference server.

Michael,

I don't know. There is another who is running APRS using the ipaq for
the mapping. But he is also using a separate KPC3+ TNC..
We do have a fairly extensive TCP/IP setup here in Seattle, I am not
sure if anyone as tried using the ipaq without a separate TNC.

Contact M0CSH at GB@AACNET.NET with the subject CONF SERVER REQUEST
and decide a *NAME* for your conference server, also a password. All
conference servers have a name starting with *, and it is usual to end
in * also.

Ok thanks!

Also we would be volunteer to run a directory server, where the clients
log on, is that software available too?

I'm looking for a good low-cost radio for pactor. Ideally it would have a
500 Hz
filter that works on ssb.

Does anyone know if the Icom IC-718 500 Hz filter will work?
Any other suggestions for a transceiver?

tnx,
KG0T

You asked for an IP stack, but what you need is an AX.25 protocol
implemetation that will sit below such a stack.

SV2AGW made such a beast for Windows, maybe it can be used with CE?

I agree a bunch of us here in South NJ just started using MMSSTV and its
great
for beginners and Feature Packed One Draw Back is it uses only BMP or
JPG
graphics formats where the $50 W95SSTV use almost all Guess its pref. Im
strapped for cash as well as some of the other hams here so MMSSTV was
the
choice I LOVE it works with my sound card and currently using it with my
YAESU
1500M through its data port (My HF is down)works great on our repeater
we get in every night and swap pics.

There is no software available to run separate directory servers, The other servers you see are just backups for the main server. All iLINK users are on the one server. This must be for security control. If separate servers were available it would be difficult to make sure than non-amateurs could not use the system.

I'd be curious to know more about his setup - I'm in Portland and I honestly don't know whats going on here packet wise since I'm kinda new at this :).

I don't think the ipaq could do packet without a hardware tnc - its cpu (sa1110) isn't really suitable for emulating a dsp.

Hello All,

I have uploaded CwGet 1.25 to the main site and mirrors:
         http://www.dxsoft.com/cwget.zip
         http://www.hamport.com/cwget.zip
         http://www.8ung.at/dxsoft/download/cwget125.zip

Best regards,
 Sergei                              mailto:amx@dxsoft.com
```

http://www.dxsoft.com

===
CwGet Versions History.

CwGet Versions History.

V1.25
  If there are several sound cards in a computer, you can select the
card by
  the "SoundCardNumber" parameter of [CwGet] section of the CWGET.INI
file.
  "SoundCardNumber=0" means a first sound card, "SoundCardNumber=1"
means a
  second card etc. Negative value means system default sound card.
  The command "File->Open Buffer in Notepad" was made. It saves
receiving
  buffer in a temporary file and opens this file by a text editor.
Then you
  can view this file or print it. The hotkey of this command is
Ctrl-N.
  This command is available in registered version of the software
only.
V1.24
  The main filter and amplitude detector were fully rewritten.
  A set of main filter bandwidths was extended.
  Alt-D shortcut was made for the "Clear Buffer" command.
V1.22
  The problem with spectrogram repaint on some computers was fixed.

Also consider the very well supported UI-View program at only about $15.
Constantly updated and fits into the average ham's budget much better. You
can find UI-View here:

http://www.ui-view.com/index.shtml

Have been trying to direct key my Kenwood TS-940 using CWType and the
Rigblaster Plus without success. Anyone been able to do this? Would sure
appreciate help on setting up the CWType.ini file, Rigblaster jumpers, etc.

If you are picking a sound card for your PC to be used for the digital modes, you may want to check out
http://www.pcavtech.com/soundcards/compare/index.htm

The site compares the various sound cards. Many have poor SNR's.

Rob

Hi all,

For some weeks now, I've been thinking (obscessed) about IEEE802.11 in the HAM radio bands. Searching the web and newsgroups with Google didn't show much talks about this, any ideas why?

Here are some ideas I've come up with:

First, here's a summary of the two present IEEE802.11 options:

IEEE 802.11b (the most common)
Freq range: 2.4 GHz
Data rate: Up to 11 Mbps
Range: 100 meters (omnidirectional)

IEEE 802.11a
Freq range: 5 GHz
Data rate: Up to 54 Mbps
Range: 50 meters (omnidirectional)

What I'm looking for is something like:
Freq range: UHF (around 800 MHz - in the ham radio freqs)
Data rate: 3 Mbps (or whatever we can acheive)
Range: 30 km (omnidirectional)

We could use existing 802.11b controllers (like Cirrus Logic's CS22250) and we would only need to make our own Digital Radio PHY. I guess it would be best to make an adapter between standard HAM rig and the 802.11b controller.

Standard 802.11b uses the unlicensed 2.4 GHz band and must use Spread Spectrum (DSSS and FHSS) to cope with interferences caused by other devices using these unlicensed frequencies. This is different in a HAM radio situation, since:
1) there should not be much interference (we'd use HAM licenced bands)
2) we can legally emit a much stronger signal. I beleive that standard IEEE802.11b emits a 100mW signal, we could use 2W or more depending on the situation.
Because of this, I guess it would be preferable to modulate the signal on one frequency (no spread spectrum).

Any idea on how technically/legally feasable this is? This idea is more day dreaming than reality so don't be shy to day dream with me... 8)

73,
GFK's

You need the Kenwood computer connection cable and a null modem adaptor.

Connect the Psions serial cable to the Kenwood cable with the adaptor.
Thats it.

Ray

On top of what you are thinking, I'm a solid OS/2 operation .. While it is a WONDERFUL platform for mission critical stuff, the limited driver ability in some areas is a problem. Artem cards and Cisco cards are said to be fine with OS/2 and have drivers for OS/2. But, as you point out, the range is minimal. Even if we were to go forward with gain antennas made up for these cards, we still face the problem that feed line losses are really an issue.

In my case, the path length needed is 15 statute miles line-of-site, more or less. That leaves the only real solution that I can see of running the whatever hardware combo as a pure 10base-whatever connection over the 150 feet or so to the shack. Then running the DC power up the minimal 60 foot towers to get to the unit-pack which will relay across ham band freqencies to where it is needed.

In essence .. what is really needed is not only the protocol aware stuff, but a 10base-whatever boxlet which we can all use to reach out for the height to get wherever!

Once we get to 10base-whatever, the op-system inside it shouldn't be a problem for anyone .. Win or OS/2 or LINUX or UNIX or AIX or whatever!

You have a node out there on the LAN. It does what it needs to do to be an interface ..

Or am I all wrong here?

--> Sleep well; OS/2's still awake! ;)

Amateur Radio Newsline™ Report 1282 – March 8, 2002

Amateur Radio Newsline report number 1282 with a release date of Friday, March 8th, 2002 to follow in 5-4-3-2-1.

The following is a Q-S-T.

The Dayton Hamvention announces the EMMY AND OSCARS of Amateur Radio. We have the winners on Amateur Radio Newsline report number 1282 coming your war right now.

(Billboard Cart Here)

**

HAMVENTION 2002: AWARD WINNERS NAMED

The Dayton Hamvention has named Radio Amateur Information Network founder Alanson “Hap” Holly, KC9RP, as its 2002 Radio Amateur of the Year. Holly received the news of his selection on Thursday evening February 28th in a phone call from Cathi Hoskins, N8ZCQ, who chairs the Hamvention Awards and Banquet Committee. KC9RP tells Amateur Radio Newsline that he was completely taken by surprise:

--
Holly KC9RP: “I was absolutely stunned! In fact, all I could say was me? I mean seriously, I was just absolutely floored.”
--

Holly, lives in Des Plaines Illinois has been licensed since 1965. He began his ham radio informational programming career in 1984 on a local Chicago Area repeater. This eventually lead him to become founder, moderator and guiding light of a weekly amateur radio audio feature magazine known as the RAIN Report.

--
Sample audio from Rain Report.
--

RAIN programming is distributed to hundreds of repeaters across the country via a telephone dial-up line, the rainreport.com website, by a subscription tape service and broadcast over W-A-Zero-R-C-R's weekly 160 meter informational net.

But that’s is only a small part of the Hap Holly story. Originally licensed in Escondido California at age 14, Holly who has been blind since age 7 served as a phone-patch station and net control for the famed WESTCARS traffic net until 1970. He then headed off to Principia College in Illinois and from 1970 to graduation in 1974, ran phone patches and kept radio schedules for many of his fellow students.

Holly graduated Principia with a Bachelor of Arts degree in Sociology, and soon found himself in the Chicago area. There, he sought out world-class jazz accordionist Leon Sash, to pursue further training in music. As a professional keyboard player, Holly’s diverse repertoire of American music of the past six decades has made him a popular choice in the Chicago area.

Hap met his wife-to-be while he was teaching a class in non-visual perception to high school students at a summer camp in Buena Vista, Colorado. The two were married in August of 1976. Stephanie, who is sighted, received her ham ticket and KA9WKD callsign in 1986.

Over the years, Hap Holly has written articles for the Spec-Com Journal, Radio Scan Magazine and occasionally reports for us here on the Amateur Radio Newsline. Holly is also a common sight at the Dayton Hamvention, taping forums which are then incorporated throughout the year into his RAIN Reports. And since 1975 KC9RP has been an honored member of the Des Plaines Lions Club. He has also been a member of the Des Plaines Toastmasters since 1976. He and Stephanie are also active with Des Plaines Illinois Emergency Medical Alert system.

Named as this years Hamvention Technical Excellence award winner is Alan

Waller, K3TKJ, of Laurel, Delaware. Waller was chosen for his work that lead to the interfacing the Internet to Amateur Radio.

First licensed in 1961, Waller combined his decades-long love for Amateur Radio and a burgeoning interest in the then-new Internet to design and manage the www.qsl.net and www.qth.net web sites. That was back in 1993. Since that time, Alan Waller's web sites have come to serve the needs of tens of thousands of ham radio operators worldwide by providing a vast technical reference platform, an electronic mail service, web page hosting services, and links to thousands of other ham radio related sites. And in the true spirit of the Amateur Radio, Waller's initial work utilized leading edge experimentation to see what could be done with the technology then available. This has developed into a mature, reliable service to the world wide ham radio community.

Rounding out this seasons winners are a pair of pair of space exploring hams who have been named as co-recipients of the 2002 Hamvention Special Achievement Award. Former astronauts Owen Garriott, W5LFL, and Tony England, W0ORE, are being honored for paving the way for manned ham radio operations from the space shuttles that has made ham radio a permanent part of mans exploration of space.

Owen Gariott, W5LFL was first. On November 28, 1983, Garriott, was launched into space aboard the space ship Columbia for the STS-9 mission. It was the Spacelab 1 mission and Garriott brought along the first Amateur Radio station on a crew-tended space vehicle. It was a simple Motorola hand held transceiver connected to a special antenna designed to fit in the Space Shuttle’s window.

Three days later, W5LFL came on the air and hams across the United States and around the world were witness to a historic radio transmission:

--

Owen Garriott W5LFL: “This is W5LFL in Columbia. W5LFL in Columbia orbiting the Earth at an altitude of 135 nautical miles passing over the U.S. West Coast and calling CQ.”

--

Among those who heard Owen Garriott's Amateur Radio transmissions from space was Lance Collister, WA1JXN of Frenchtown Montana. Collister, who is now W7GJ, is credited with being the first amateur to work an astronaut in orbit. Take a listen:

--

Lance Collister WA1JXN/W7GJ: “W5LFL on Columbia, WA1JXN, W-A-1-Japan - Xray-Norway, WA1JXN Frenchtown Montana standing by.”

Owen Garriott, W5LFL: “Hello W1JXN, WA1JXN, WA1-Juliet-Xray-November. This is W5LFL. You’re our first contact from orbit. WA1JXN, how do you read? Over?”

--

The success of Garriott’s mission lead to the development of SAREX -- The Shuttle Amateur Radio Experiment. And, over the years, SAREX permitted youngsters in classrooms around the world to speak directly with astronauts in space. But for this to happen, the technology of manned ham radio operations from space had to be enhanced. This aspect of the then new SAREX program fell to the next ham radio operator orbited: Tony England, W0ORE.

W0ORE flew into space on the shuttle Challenger in 1985. It was Mission 51F, Spscelab 2. In addition to the 2 meter FM voice gear, Tony England also had with him the first ever ham television station to go into space. Slow Scan yes, but capable of sending back high resolution images which hams on the ground equipped with SSTV gear could view live or record on a simple audio cassette for later viewing and historical archiving. From space, Tony England described the station he was using:

--

Tony England, W0ORE: “Essentially we’ve got a commercial TV camera that anyone could go out to their local radio store ant buy. We feed this into a scan converter built by a commercial outfit and modified by NASA Amateur Radio clubs and this takes a snapshot of the scene and digitizes it and put it in a memory.

Then its sent to a handie-talkie like this. From there we will send it over a wire up to the upper window upstairs and to this antenna when I get it up there in the window. Then it will be transmitted to the ground.

When we get going, we will be able to send color TV images of what we are doing on board as a series of snapshots updated every 10 or 20 seconds. Amateurs anywhere on the ground will be able to receive them, and ones with scan converters will see the pictures.”

--

That flight also marked another first. The first ever two way television -- ham radio television -- to and from space.

Tony England went on to flight prove both the improved FM voice and then new SSTV systems. The SSTV was so successful that NASA gave very serious consideration to a permanent installation on all shuttles for back up communications. More important, the early on-orbit operations by Own Garriott W5LFL and Tony England W0ORE made possible the thousands of educational contacts between children in school classrooms and the crews flying in space. First, on board the shuttles, and now as a permanent part of the International Space Station.

Hap Holly KC9RP, Alan Waller K3TKJ, Owen Garriott W5LFL and Tony England W0ORE will receive their honors at the Hamvention Awards Banquet slated for Saturday evening, May 18th at the Nutter Center in Dayton Ohio. Amateur Radio Newsline will be there to bring you this story and all the news about Hamvention 2002. (ARNewsline™ from Dayton Hamvention® news release. Some audio from “Amateur Radio’s Newest Frontier” and “SAREX - The Shuttle Amateur Radio Experiment” video presentations)

RADIO RULES: FCC RESUMES VANITY PROCESSING

Vanity license processing is getting back on tract. According to a Legaue bulletin the FCC now has all outstanding vanity applications filed last October in hand and is ready to resume routine vanity processing. Until recently a single missing vanity application had been holding up a backlog of more than 2000 vanity applications. The FCC credits the ARRL in part with helping to locate applicants and resolving the problem. (ARRL, FCC)

**

RESCUE RADIO: AMATEUR RADIO EMERGENCY COMMS SUMMIT

The first ever Amateur Radio Emergency Communications summit was held in Indianapolis last week. Amateur News Weekly's Jack Parker, W8ISH, reports on the success of this first meeting.

--

They came from the Red Cross, Salvation Army, ARES, RACES and even CB-radio's REACT team. Two dozen representatives of different Amateur Radio emergency communications groups met in a Federal Building training room to find ways of helping local and state emergency management organizations. The summit was organized by Marion County ARES director Mike Palmer, N9FEB.   Palmer cited a need to develop better communications and cooperation between the different groups.

Many amateurs wear two or three different hats when it comes to providing public service. Palmer wants to identify those who are willing to help and to better utilize the voice and data communications available in the Marion County Amateur Radio Community. Many of the summit participants agreed this type of effort is long overdue.

Members of Army-Navy and Air Force Mars, as well as the Indiana Wing of the Civil Air Patrol offered their services during times of disaster. Everyone agreed this was a good start and look forward to future efforts to better train and organize Amateur Radio Emergency Communications in Marion County and Central Indiana.

Reporting from Indianapolis for Amateur News Weekly, this is Jack Parker W8ISH.

--

According to Jack, everyone came away from the meeting knowing that cooperation between groups is a key element in providing better service to the public.

(ANW)

**

RADIO RULES: FCC ADOPTS AMBER EAS EVENT CODE FOR CHILD ABDUCTION CASES

The Federal Communications Commission has announced the adoption of a Report and Order amending the Emergency Alert System rules. Included are several new EAS event and location codes, which broadcast stations and cable systems may use to alert the public in the event of state and local emergencies. Of these, a new Child Abduction Emergency event code may be the most interesting to hams involved in Search and Rescue and who have E-A-S decoders installed in their repeaters.

The plan is described as a voluntary partnership between law enforcement agencies and the media that will be used to alert the public of serious child abduction cases where police believe that the child is in danger of bodily harm or death. Under the plan, radio and television stations will be permitted but not required to interrupt programming to disseminate information concerning serious child abductions when the new Child Abduction Emergency code is received. It could also be used by hams as an automated call to action to help find a missing child if used to activate an E-A-S equipped Amateur Service repeater.

Police departments say that every minute counts in dealing with an abducted child situation. In adding the Child Abduction Emergency code the FCC says that its responding to public concerns. (FCC)

**

ENFORCEMENT: FCC COMPLETES GEORGIA ARRL VEC EXAM SESSION AUDIT

The FCC has wrapped up an investigation into apparent irregularities at five ARRL VEC-sponsored Amateur Radio examination sessions in Georgia during 2000 and 2001. As a result of the probe, FCC Special Counsel Riley Hollingsworth says that several examinees will be called back for partial retesting:

--

Riley Hollingsworth: “We determined reviewing all of the information that was brought to our by the League that eight examinees will have to be retested on the code element. The ARRL has also relieved ten VE’s of their duties as volunteer examiners.”

--

According to the ARRL Letter, all V-E’s who might have been involved were suspended after the FCC investigation began last year. (FCC, RAIN)

**

ENFORCEMENT: A REPEATER OUTSIDE OF THE BAND

The FCC is also looking at the operation of repeater in the Metro New York City area. Again, the FCC’s Riley Hollingsworth:

--
Riley Hollingsworth: “We opened an inquiry into allegations that an uncoordinated repeater operated by Thomas Batista, KC2DDD, and Gerardo Arias, N2IFU, in Corona and Staten Island New York. Now that repeater is not only causing interference to a coordinted repeater, but the input is apparently on a frequency not even allocated to the Amateur band. So, needless to say we are real interested in reviewing that response when it comes in.
--

What Hollingsworth will be looking for is an answer to why the machine is using 143.020 MHz as an input frequency as well as why its on the air without coordination. 143.020 MHz is a full 800 Kilohertz below the bottom edge of the 2 meter Amateur band. (FCC, RAIN)

**

CONVENTIONS: SOUTH EAST VHF SOCIETY CONFERENCE

On a far lighter note, the Sixth Annual Southeastern VHF Society Conference will take place April 26th through the 27th in Oak Ridge, Tennessee. And they too are putting out a call for papers. If you are interested in participating, please contact KG4QDZ by e-mail to kg4qdz@arrl.net. (VHF Reflector)

**

CONVENTIONS: CHARLESTON HAMFEST MARCH 16

And the 18th Annual Charleston Area Hamfest and Computer Show will be held Saturday, March 16, 2002 from 9 AM to 3 PM at the Coonskin Armory in Charleston, West Virginia. Talk-in is on the 145.35 MHz repeater. Admission is $5 and there will be free parking. More information is available by e-mail to n8tmw@arrl.net. (N8TMW)

**

HAM RADIO POLITICS: NCI LEADER CALLS FOR ELECTIONS

Bruce Perens, K6BP, the founder and an incumbent director of No Code International says that its time for new directions for the group and has called for elections. Amateur Radio Newsline’s Norm Seeley, KI7UP, has more:

--
According to Bruce Perins, K6BP, when he started NCI in 1997, he never dreamed that it’s goals would be achieved so quickly. But says Perins; “we are

most of the way there.”

Perins notes that last year the International Amateur Radio Union voted to ask for the removal of the international treaty provision requiring Morse Code testing for Radio Amateurs. Now Perins observes that even ARRL has voted in favor of removing code requirements from the international Radio Regulations.

With what he terms as -- no remaining credible opposition to NCI's cause left on the international level -- Perins says that it is time to turn NCI’s focus to domestic policy. He says that for NCI to take an appropriate role in the end-game of the no-code battle means cooperation with national societies like the American Radio Relay League. And to do this, Perrins believes may take some new people.

So Perins has asked that an election for new directors be held no later than April 30th of this year. He also says that any person who was an NCI member on December 31, 2001 can be a candidate for director, and is eligible to vote in the election.

For the Amateur Radio Newsline, I’m Norm Seeley, KI7UP.

--

More information about No Code International is on the web at www.nocode.org. (ARNewsline with information from K6BP)

HAM RADIO IN SPACE: AO-40 GPS TEST RESULTS PUBLISHED

The February issue of GPS World included an article titled Formation Flying in Space. Authored in-part by AMSAT North America's Frank Bauer, KA3HDO, the essay shows G-P-S results from the receivers that NASA’ Goddard Space Flight Center provided for flight on the AMSAT OSCAR 40 bird. According to Tom Clark, W3IWI, the data shown in the article was downloaded using AO-40's RUDAK system by WD0E and KB0G. (ANS)

**

WRTC-2002: ORGANIZING COMMITTEE ANNOUNCES THE COMPLETE LIST OF OFFICIAL ON-SITE REFEREES

The WRTC 2002 Organizing Committee has named a full list of on-site referees for the upcoming games. The committee says that it received more than 100 highly qualified applications and those chosen were from that group. A full list of referees and other information is available on the web at www.wrtc2002.org (WRTC2002)

**

DX

In D-X, word that Dave Cree, G3TBK, has returned to work in the Caribbean.

Throughout March Dave will be active as J88DR from St. Vincent. For the first two weeks of April look for him J3 slash G3TBK from Grenada. Operations will be on all bands, but concentrating on the WARC bands, mostly on C-W, but with some SSB. QSL to Dave's home call either direct or via the RSGB bureau. (RSGB)

The New Zealand Amateur Transmitters Society is warning hams world wide of what they say is a pirate operation. According the NZART News, a maritime mobile station using the callsign ZL2TO and the name Tony has been heard recently operating on nets on 15 Meters. This station currently gives his location as the Cape Verde Islands. Only one problem. The ZL2TO call sign is allocated the Waitara Amateur Radio Club. (NZART)

And the South Africa Radio League news service says that anyone who has held a QSO's with 7Q8 slash ZS6GH or C9 slash ZS6GH should write them off . SARL says that these have been declared null and void because license or authorization to operate was issued by the telecommunications regulators in Malawi or Mozambique. (SARL)

**

THAT FINAL ITEM: NOMINATIONS SOUGHT FOR THE YOUNG HAM OF THE YEAR AWARD

And finally, we started this weeks newscast with a story about awards. Lets end it on a similar note as we here a Amateur Radio Newsline officially open the 2002 nominating season for our own Young Ham of the Year Award.

The Young Ham of the Year award was created in 1986 by amateur Radio Newsline producer Bill Pasternak, WA6ITF, to fill what he viewed as a void where younger members of ham radio society were often overlooked:

--
Bill Pasternak, WA6ITF: “When I was a young ham in the 50’s and 60’s the good deeds of young hams were often overlooked and ignored. When I grew up I was fortunate enough to be in a position to remedy this and thats how the Young Ham of the Year Award program came about. Thats how it came into being”
--

The award as originally envisioned as very low budget. One idea was for a certificate that would be mailed to a ham, age 18 or younger who had shown some exceptional ability or performed some heroic deed that set him or her apart from the crowd. When Bill mentioned the idea to Chip Margelli K7JA, of Vertex Standard back in the company’s days as Yaesu USA, the idea quickly expanded. Margelli offered company support on the spot:

--
Chip Margelli, K7JA: “When Bill Pasternak gave me a call and dsescribed the project to me in the tiniest bit of detail it was obvious that this was a no-brainer and something that we as a company at Yaesu wanted to encourage. So, I jumped at the opportunity to be a major contributor and it has been a great project ever since.”
--

The award now had substance, but it lacked a permanent home. One was found in

1993 when it was invited to the Huntsville Hamfest:

--
Bill Pasternak, WA6ITF: “The way we got to Huntsville? Simple. We advertised. We put a notice into the newscast that we were searching for a permanent home. The answer came in a note from Scotty Neustadter, now W4WW, who is the Huntsville Hamfest Chairman. Scotty basically said bring it to Huntsville. And we did.”
--

While the presentation ceremony did go to Seaside Oregon in 1994, it returned to Huntsville in 1995 where it has been ever since. And in 1996 a second major corporate underwriter came on board. C-Q Magazine. Rich Moseson W2VU, is editor:

--
Rich Moseson, W2VU: “We at CQ have always thought that it is very important to promote Amateur Radio to young people and we saw that co-sponsorship of the award was the way to help do that.
--

What CQ did was to add to the Young Ham of the Year awards chest something very special. A week of fun and excitement at Spacecamp. Today, with corporate sponsorship from Vertex-Standard USA and CQ Magazine, and support from countless others including the ARRL, Dave Bell Associates and Rosewood Communications the Young Ham of the Year Award continues to honor the Amateur Radio related achievements of those hams age 18 or younger. And now its time to find a fitting recipient for 2002.

Full details, rules and a nominating form are available right now on our website at www.arnewsline.org. Just scroll down to the Young Ham of the Year Award area and click to download. Or you can send a self addressed stamped envelope to the 2002 Newsline Young Ham of the Year Award, 28197 Robin Avenue, Santa Clarita California 91350 and we will mail back the materials.

The Amateur Radio Newsline Young Ham of the Year Award is a one of a kind. It honors the youth of ham radio and in doing so, we hope it helps to insure a bright future for the hobby and the radio service that all of us love. (ARNewsline™)

**

NEWSCAST CLOSE

With thanks to Alan Labs, Amateur News Weekly, AMSAT, the ARRL, the CGC Communicator, CQ Magazine, the FCC, the Ohio Penn DX Bulletin, Radio Netherlands, Rain, the RSGB and Australia's Q-News, that's all from the Amateur Radio Newsline(tm). Our e-mail address is newsline@arnewsline.org. More information is available at Amateur Radio Newsline's(tm) only official website located at www.arnewsline.org. You can also write to us or support us at Amateur Radio Newsline(tm), P.O. Box 660937, Arcadia, California 91066.

Before we go, another reminder that the nominating period for the 2002 amateur

Radio Newsline Young Ham of the Year is now open. Nominees must be 18 or younger. Full rules and an application is on our website at www.arnewsline.org.

For now, with Bill Pasternak, WA6ITF, at the editors desk, I'm Roy Neal, K6DUE, thank you for listening." Amateur Radio Newsline(tm) is Copyright 2002. All rights reserved.

Hi GF,

Intriguing concept.

There's a group working on similar schemes and they have lots of technical info at their web site.

They are located in Green Bay, Wisconsin (I think that's one of the southern provinces of Canada).

Their web site is: http://www.qsl.net/n9zia/index.html

The range figure sounds a bit high for non-LOS but a bit short for line of sight paths, but let's assume that we can do 100 m with 100 mW (+20 dBm) EiRP.

>What I'm looking for is something like:
>Freq range: UHF (around 800 MHz - in the ham radio freqs)
>Data rate: 3 Mbps (or whatever we can acheive)
>Range: 30 km (omnidirectional)

From the reduced data rate, add +5 dB of received signal power.

Due to the lower frequency, the path loss is reduced, add +10 dB.

Assuming non-obstructed LOS path (which are quite rare at 30 km) the correction is -50 dB.

Adding it all up +20 dBm - (5 dB + 10 dB - 50 dB) = +55 dBm = 300 W of transmitter power is required.

For non-unobstructed paths, add an additional 0 .. 50 dB to the path loss (when going from true LOS to troposcatter), thus the required transmitter power is far above the legal limit transmitter power. The only realistic solution is to use directional antennas at one or both ends of the link.

>Standard 802.11b uses the unlicensed 2.4 GHz band and must use Spread
>Spectrum (DSSS and FHSS) to cope with interferences caused by other

Are you talking about satellite to satellite or satellite to ground communication, in which case even simple FSK/PSK might work with such speeds ?

In communications between two stations on the ground, there is a huge amount of interference due to multipath propagation. For any higher data rates, some forms of spread spectrum or multicarrier (OFDM) is definitely required, in addition to the normal bit interleaving and ECC.

>2) we can legally emit a much stronger signal. I beleive that standard
>IEEE802.11b emits a 100mW signal, we could use 2W or more depending on
>the situation.

Still there is the 100 - 1500 W legal limit depending on the country. High data rates and long distances require a considerable amount of effective radiated power. If you insist on omnidirectional antennas, the required transmitter power is enormous.

Don't know how they are set up to start, but just make individual
folders for each one, and copy the entire contents to the folder(s).
Then RUN the file that starts the program.

anyone using the DR-135TP as an APRS digi?
i would appreciate a copy of any digi setup
paramaters that have been found to work...

thanks

Why?

Where is the spec?

I keep asking, so we can have an actual technical discussion.

How does MURSLink work?
 - In a previous post you talk about slotted Aloha, but don't use that term.
 - Why?

Does it use some protocol other than AX.25?
Does it use HDLC?
 - Ok, it uses HDLC at layer 1.

What does it provide at layers 3 and 4?
Is there a broadcast protocol?

How is station identification handled?
 - You mentioned some ideas about how it might be handled.
 - By noticing which slot is used.
 - What did the FCC say about that?

Is there an existing STA for this protocol?
Would it be a good protocol for weak signals?
Would it be a good protocol for HF?

Can existing TNCs be retrofitted?
 - Will use KISS and existing TNCs.
 - Thus it uses HDLC at layer 1.

Is there a software implementation a la Baycom?
What are the requirements for the radios?
What speed do these requirements imply?

Try and get this back on topic: tell us about the radio part.

Why is this "better" than what was done in Vancouver / Montreal prior to 1984?

A "Portable Application Specific", "Dynamic Slot Assigning",
"Internet-Backboned Routing", "Long Slot Dwell" derivation of Slotted
Aloha is a better description.

AEA went bankrupt, but Timewave still supports the PK series of TNCs
including the PK-88. Timewave bought the AEA TNC line back in 1998.

Technobabble.

Here are the questions again, in case you would care to answer
them with some useful information. Perhaps the other poster
was correct: you have some vaporware and are trying to see
if you can create a business with it. From what I've seen so far,
that seem to be the case. How does it apply to Ham Radio?
In particular, what has the FCC said about the protocol?

> MURSlink will NOT be proprietary. MURSlink can be run over any

Note the keywords: "will NOT be".
That is very different from "is not".
Then note: "can be run".
That implies something exists already.
Care to tell us about it?

> KISS-mode TNC or SoundCard - but for PDA applications, it will work
> better thru a PubCel MURSnode :)

Why?

Where is the spec?

I keep asking, so we can have an actual technical discussion.

How does MURSLink work?
- In a previous post you talk about slotted Aloha, but don't use that term.
- Why?

Does it use some protocol other than AX.25?
Does it use HDLC?
- Ok, it uses HDLC at layer 1.

What does it provide at layers 3 and 4?
Is there a broadcast protocol?

How is station identification handled?
- You mentioned some ideas about how it might be handled.
- By noticing which slot is used.
- What did the FCC say about that?

Is there an existing STA for this protocol?
Would it be a good protocol for weak signals?
Would it be a good protocol for HF?

Can existing TNCs be retrofitted?
- Will use KISS and existing TNCs.
- Thus it uses HDLC at layer 1.

Is there a software implementation a la Baycom?
What are the requirements for the radios?
What speed do these requirements imply?

Try and get this back on topic: tell us about the radio part.

Why is this "better" than what was done in Vancouver / Montreal prior to 1984?

Hey all... Have a copy of the above mentioned software, which I got with a Kantronics Interface at a flea market. The software works fine, but there's no documentation. Can anyone assist or direct me to a site where I can download the docs for Hamtext?

Also would like to test drive other Kantronics Interface compatable programs for the C-64/C-128 platform, including, but not limited to, Hamsoft/Amtor, Amtorsoft and Supertap.

In the documentation for the Interface unit I bought, it mentioned that the software is sold in cartridge form for the C-64. Strangely enough, the copy of Hamtext that I have is on a diskette. Would prefer software versions over firmware/cartridgeware versions of the programs..

Any assistance granted would be GREATLY appreciated. This is my first foray into the realm of digital HF communications (other than manual CW), hopefully I'll be moving into PSK31 soon...

> - In a previous post you talk about slotted Aloha, but don't use that term.
> - Why?

I fashioned the time-slotting mechanism from ideas garnared from
working with JTIDS... someone else pointed out to me that it was like
Slotted Aloha... I looked at the Slotted Aloha design afterwards, and
agreed... but - it was not derived from Slotted Aloha... JTIDS, maybe,
but only in the most loosest sense.

> Does it use some protocol other than AX.25?

Doesn't use AX.25 at all.

> Does it use HDLC?
> - Ok, it uses HDLC at layer 1.
>
> What does it provide at layers 3 and 4?

Layering is for the birds... it is what it is... you can try to
pigeon-hole it if you want.

> Is there a broadcast protocol?

Not per se, the Access Points "broadcast" time slot allocations at
fixed intervals, and users are expected not to interfere during these
time periods.

> How is station identification handled?
> - You mentioned some ideas about how it might be handled.
> - By noticing which slot is used.
> - What did the FCC say about that?

It meets the rules, so the FCC can't say jack.

> Is there an existing STA for this protocol?

Doesn't need to be - because it won't be an autoforwarding system, in the old sense.

> Would it be a good protocol for weak signals?

The are no design considerations for this - other than the fact that error correcting and inteleaving will be experimented with to determine their usefulness, based on real-world situations.

> Would it be a good protocol for HF?

No.

> Can existing TNCs be retrofitted?

If they run KISS, they are golden.

> - Will use KISS and existing TNCs.

Yes.

> - Thus it uses HDLC at layer 1.

Nothing wrong with that.

>Is there a software implementation a la Baycom?

I suppose you could say that.

> What are the requirements for the radios?

Look at Part 97.

> What speed do these requirements imply?

Optimized for 1200bps to 19200bps with up to 3 users per channel.

> Try and get this back on topic: tell us about the radio part.

There is nothing to tell.

> Why is this "better" than what was done in Vancouver / Montreal prior to 1984?

Because the applications have changed since 1984... and because we have the Internet now... and because computers are about 10,000 times faster now... and because we now have GPS position reporting... and because handhelds can replace TNC CPU functionality... and because we have Cable Modem's and DSL... the world is TOTALLY different... the only thing that has stayed the same is Shannon.

Amateur Radio Newsline Report 1280 – February 22, 2002

Amateur Radio Newsline report number 1280 with a release date of Friday, February 22nd, 2002 to follow in 5-4-3-2-1.

The following is a Q-S-T.

Ultra-wideband is here and the fight to keep high power unlicensed devices off of 70 centimeters escalates. These stories are first on Amateur Radio Newsline report number 1280 coming your way right now.

(Billboard Cart Here)

**

SPECTRUM ALLOCATIONS: FCC APPROVES ULTRAWIDEBAND

The nation's communications regulators have approved limited use of a new technology that is actually capable of seeing through walls, finding disaster victims and even preventing car crashes. Known as ultra-wideband, is a new method of wireless transmission is being promoted as a potential solution to the squeeze on the nation's airwaves created by the explosion of mobile phone, pager and other wireless device usage. We have more in this report:

--

Ultra-wideband devices will for now operate only in 960 MHz and in the 1.99 to 10.6 GHz bands. In theory, at least, you should never even know that they are there. This is because proponents of ultra-wideband claim that interference to other spectrum users is virtually non-existent -- based on the ultra short duration and pulsed nature of the transmissions. And the

Federal Communications Commission agreed when it voted unanimously about a week ago to allow the technology to be used on a limited unlicensed basis.

The FCC proceeded cautiously out of uncertainty whether ultra-wideband could coexist with other strategic services. In other words, it wanted to be certain that it would not cause harmful interference to military communications, cellular telephones and the Global Positioning System. So it only provided ultra-wideband access to a small portion of R-F real estate. None-the-less, the real-life implications of the limits of the FCC decision are far reaching.

Up to now the military has been the only ultra-wideband user. This FCC action will allow for wireless communications and accurate readings of location and distance that have a wide range of civilian applications. For the general public this includes wireless, high-speed transmissions over short distances. Possibly as a way of sending video from a camcorder to a television set or data from a personal digital assistant to a laptop computer. The technology might also include sensor systems in cars to alert a driver to movement near the vehicle. This could prevent collisions and promote smart air bag deployment.

Otherwise, the FCC has limited use of ultra-wideband technology to public safety. Only police and fire officials, scientific researchers, mining and construction companies will be permitted the use of so-called ground-penetrating radar devices. These would only be permitted to radiate straight down with little or no signal leakage in any other direction. The FCC notes that this system could help rescuers find victims in rubble following a disaster or locate ruptured underground pipelines without digging up entire neighborhoods.

The FCC severely limited distribution of ultra-wideband devices that can see through walls and detect motion within certain areas. Only law enforcement and firefighters will be permitted to have them. In other words, you won't soon be buying a home camcorder that can peer through your wall and into your next door neighbor's apartment. And you probably never will.

Right now the introduction of ultra-wideband will have very little impact on ham radio due to the limited spectrum being allocated to it. But it's use could be expanded in the future if it's proved not to interfere with existing military and public service communications.

For the Amateur Radio Newsline, I'm Robert Sudock, WB6FDF, in Los Angeles.

--

If ultra-wideband is successful it could eventually open up a whole new world of communications for ham radio. For starters, think in terms of so-called smart software defined radios. Radio’s that are so smart that you tell it who you want to talk to and it calls you when that person is ready to hold a QSO.

More on this emerging technology in future Amateur Radio Newsline reports.
(FCC and other published reports)

**

SPECTRUM SHARING: SAVI TECHNOLOGY VS. HAM RADIO

The fight to keep radio ID tags off the 70 centimeter ham band is entering the home stretch. This is because the FCC has set March 1st as the deadline for reply comments on RM-10051.

RM-10051 is the Rule Making designation given to a request from SAVI Technologies, Inc. As previously reported, SAVI has petitioned the FCC for it to be allowed to develop and market a family of Part 15 devices designed to operate on the amateur 70 centimeter band. These Radio Frequency Identification Tag devices would operate at a power level far higher than similar devices now marketed and that's where the real problem with the proposal lies.

Ham radio educator Gordon West WB6NOA, is an expert in weak signal operations. West says that it will mean problems for weak signal and satellite operators:

--
WB6NOA: "I think that the presence of any strong; either continuous or intermittent signal near the weak signal portions of the [70 centimeter] band is going to dramatically cause interference to those of us that monitor for either weak signal beacons -- such as those heard on the West coast that come in from Hawaii -- or for those who operate weak signal SSB and CW satellite."
--

West says that even some of the micro power Part 15 devices already sharing the 70 CM band are causing major problems:
--

WB6NOA: "Presently on the weak signal 70 centimeter band we are having to put up with low power, intermittent [home] weather stations. You know, those weather stations that you see advertised as transmitting in their data on 432 and 433 MHz. Even these weather stations when they transmit will cause the AGC in my receiver to pump and it takes two to three seconds before the AGC returns [to normal] before I can begin listening again for weak incoming beacons.

Those [transmitters] are just a few hundred milliwatts at about 300 to 500 feet away. You can imagine when these more powerful transmitters come on the air in the 70 centimeter portion of our Amateur Radio band."
--

But exotic modes won't be the only ones affected. There is more than ample reason to believe that FM repeaters, remote base and A-T-V operations could suffer as well. And with the reply comment deadline only a few days away Dick Isley, W9GIG, the Secretary of the National Frequency Coordinators Council says that an e-mail and fax campaign to congress may be the only way to get RM-10051 killed.

In an e-mail to the Amateur Radio Newsline and other Amateur Radio publications, Isley says that it is imperative that hams send electronic messages their elected federal representatives in opposition to RM-10051.

Isley believes that if 10,000 or more hams respond to this call, the SAVI Technology proposal could become a political hot potato. Hopefully one that is so hot that the Commission drops it completely. (ARNewsline(tm))

**

SPECTRUM SHARING: THE ARRL VS. THE FCC ON SAVI TECHNOLOGY

As hams get ready to write e-mails to congress, the ARRL is following a different diplomacy. It is challenging the FCC’s authority in this matter saying that the agency 'cannot legally proceed with the rules proposed for unlicensed Radio Frequency Identification tags at 433 MHz. Jim Haynie, W5JBP, is the President of the American Radio Relay League:

--

W5JBP: “You have to go back and look at the Communications Act of 1934, as amended. What Congress said was that in equipment that puts out a signal at a certain level must be licensed. The FCC has said that they are going to make this a Part 15 device does not require a license.

Our [ARRL] argument is that they cannot do this by law. Congress would have to pass a law to allow them to make this powerful radiator a part 15 device. In other words, change the whole parameter of what Part 15 [devices] are.”

--

Haynie says that the League has said it will 'do whatever it takes to keep the FCC from putting these Radio Frequency Identification tags in the 70 centimeter band. You can hear more from President Haynie by tuning in right now to the RAIN Report. It in streaming audio at www.rainreport.com and on the phone at 847-827-7246. (ARNewsline(tm), RAIN, ARRL)

**

Break 1

From the United States of America, We are the Amateur Radio Newsline, heard on bulletin stations around the world including the WA2UGO repeater serving Mt. Beacon N.Y.

(5 sec pause here)

**

PUBLIC SERVICE: HAM RADIO AT THE WINTER OLYMPICS

Ham radio was a major player at the 2002 Winter Olympics. Not competing in the games, but working in support of overall security. Amateur Radio Newsline’s Norm Seeley, KI7UP, has more.

--

According to an ARRL bulletin, Amateur Radio volunteers assisted with security and were ready to provide back-up communication for the Winter Olympic games.

According to Utah ARRL Section Manager Mel Parkes, AC7CP, a special public safety organization called the Utah Olympic Public Safety Command was created by the various local and national public safety organizations that provide the security necessary for the international event.

According to Parkes, Section Emergency Coordinator John Mabey, W7CWK, and Brent Thomas, AC7H, from the State of Utah Comprehensive Management Office began working on this effort over a year ago. Mabey, along with Davis County Emergency Coordinator Hall Blankenship, and several other hams headed up the effort to provide emergency backup communication for the Olympic Security Command. At its height the winter games the ham radio group numbered close to 200. These radio amateurs provided back-up communications with the ability to reach numerous Olympic venues 24 hours a day.

For the Amateur Radio Newsline, I’m Norm Seeley, KI7UP.

--

Parks had some nice words for the corps of Olympics communications volunteers. He said that the hard work and dedication by all these dedicated Amateur Radio Operators certainly contributed to a very successful and safe Winter Olympic Games. (ARRL)

**

ENFORCEMENT: DON’T PLAY MUSIC ON THE AIR

The FCC has told three hams that they have been caught allegedly playing music on the air. In letters to the trio, FCC Rules Enforcer Riley Hollingsworth says that such transmissions are contrary to the Commission's rules regarding the Amateur Radio Service:

--

Hollingsworth: “We warned Ronald Marshott, N2NGY of Berkely Heights New Jersey, Frank Grzych W1FU of Johnston Rhode Island, Martin J. Bellingeri, W2OT, of Saddle Brook New Jersey and Zack Elliott K2BLU Haworth New Jersey about playing music on the 75 meter band.”

--

According to Hollingsworth the transmissions took place on 3.832 MHz on the evening of November 27, 2001. (FCC, RAIN)

**

ENFORCEMENT: FCC VS. K1MAN – CONTINUED

The saga of the FCC versus K1MAN continues. This as the FCC issues yet another letter to the Belgrade Lakes Maine ham. Among other things, this time the FCC is warning not to put phone recorded calls on the air. Riley Hollingsworth, is Special Counsel for Amateur Radio Enforcement the regulatory agency:

--

Hollingsworth: “We sent a combination warning letter and explanatory letter to Glen Baxter, K1MAN, of Belgrade Lakes Maine concerning deliberate interference, lack of station control, sending felony complaint affidavits to those whom he perceives were interfering with him; tape recording telephone conversations without permission and broadcasting them.”

--

In its letter the agency warned that it is also important for K1MAN to understand that if these matters are not resolved, his ham licenses will not be routinely renewed the next time he applies. Instead Baxter’s licenses will be designated for hearing before an Administrative Law Judge. In such a proceeding, the FCC says that Baxter would have the burden of proof to show that his licenses should be renewed. (FCC, RAIN)

**

ENFORCEMENT: ILLEGAL CORDLESS PHONE SELLER FINED

Remember those high power cordless phones that we reported on a few months ago. The ones found operating in the 2 meter and 220 MHz Amateur bands? Well an alleged source of some of these illegal devices has been told it will have to pay a hefty fine for selling them here in the United States.

On October 23, 2001, the Commission issued a Notice of Apparent Liability for Forfeiture in the amount of $7,000 to Electronics Unlimited of Miami Florida. This, for allegedly marketing of a non-compliant high-power cordless telephone called the Alcon AT 526.

The company was afforded ample time to reply to the allegations. The FCC says that Electronics Unlimited never did file a response. Based on the information before it on February 15th the FCC affirmed the forfeiture order and gave Electronics Unlimited 30 days to pay. If the Electronics Unlimited fails to pay the forfeiture within the specified period of time the FCC says that the case may be referred to the Department of Justice for collection. (FCC)

**

FM AND REPEATERS: UNYREPCO NEW MID VALLEY NY REPEATER COORDINATOR

Repeater owners and operators of other F M and packet relay devices in Orange, Putnam, and Sullivan counties in York State have adopted the Upper New York Repeater Council, Inc. to provide frequency coordination services. This was an area originally represented by the long defunct North East Repeater Association that went belly-up in the early 1970’s. It then used the services of the Tri State Amateur Repeater Council until that organization disbanded a few years ago. Since then the region has been on its own.

This process of the Upper New York Repeater Council adopting the region was completed following a review of the existing systems by the established and recognized adjacent region frequency coordination councils. The change became effective February 13th.
More information is on the available on the web www.unyrepco.org (UNYREPCO)

**

BREAK 2

Here when you need us 52 weeks a year. We are the Amateur Radio Newsline, with links to the world from our only official website at www.arnewsline.org.

(5 sec pause here)

**

EMERGING TECHNOLOGY: SURFING AT 39000 FEET

The Federal Communications Commission has granted Boeing a license to provide high-speed Internet service to airline passengers. Boeing said the FCC approval clears the way for its planned in-flight Internet service called Connexion. Connexion -- Spelled C-O-N-N-E-X-I-O-N -- will enable airlines and other commercial jet operators to offer real-time, high-speed Internet and intranet access, television and e-mail. This, while flying over United States territory and waters.   (Boeing)

**

HAM RADIO IN SPACE: A TEACHERS GUIDE TO ARISS CONTACTS

Tony Hutchinson, VK5ZAI, says that he has updated his web site with a "Teachers Guide" for schools that have been selected to speak with the crew on the I-S-S. On his pages, Hutchinson provides what amounts to a final check list of things that must be done in the weeks prior to the contact taking place. Also posted is a list of the actual questions that students have asked in the past.

Tony Hutchinson is the Amateur Radio on the International Space Station Coordinator for all of Australia. To find his very interesting resource, take your web browser http://www.electric-web.org/teachers_guide.htm. (AMSAT-NA)

**

INTERNATIONAL - SOUTH AFRICA: SARL READIES FOR WRC 2003

The Independent Communications Authority of South Africa has invited the South Africa Radio League to participate in the preparatory work for the World Radio Conference in 2003. SARL President Hans Potgieter ZS6ALJ will be joining I-C-A-S-A sub-committee 4 which is tasked to develop South Africa's position on Maritime mobile, Amateur and Amateur Satellite, and broadcasting services in the Medium Frequency and High Frequency bands. A number of specific amateur related items are on the W-R-C agenda, including the realignment of amateur and broadcasting allocations around 7 MHz, and possible revisions to articles S-1, S-19 and S-25 of the international radio rules. (SARL, Q-News)

**

CONTESTS: VHF SPRING SPRINTS

Attention VHF and UHF contesters. K4AR has announced over the VHF Reflector that the VHF Spring Sprints will be held again in 2002. The Sprints are sponsored by the East Tennessee DX Association. The dates, official rules and lots of other information can be found at www.etdxa.org/vhf.htm (VHF Reflector)

**

DX

In DX, 9V1YC reports that the 2002 South Sandwich and South Georgia DXpedition is now officially over with all operators are back home safe and sound. 9V1YC says that the DX-pedition achieved all of its goals and made an astounding 70,428 QSO's using SSB, CW and RTTY. On-air time was 80 hours at VP8THU, and 7 days, 10 hours at VP8GEO. (RSGB)

And husband and wife K1CN and N1EBL are in the Bahamas and signing C6AMM and C6AWW from now until the 2nd of March. Operation is from Harbour Island, which counts as Islands on the Air number NA-001. (RSGB)

**

THAT FINAL ITEM: HAM RADIO SEARCH AND RESCUE

And finally this week, ham radio played a big role during a simulated emergency that takes place in a somewhat unusual setting and at an unusual time. From Birmingham, Alabama, Newsline's David Black, KB4KCH, reports:

--

Most emergency drills take place during the day, maybe in a parking lot or open field. But volunteers in Alabama put on their jackets and hiking gear and grabbed their flashlights for an exercise near Birmingham February 8th. The setting: Oak Mountain State Park, Alabama's largest park with 60-thousand acres and dozens of miles of trails. Members of the Vulcan Trail Association practice what they might have to do for real. James Pilman, KA4ZQA, is event coordinator:

--

PILMAN
BITE IN This is a search
OUT a couple more

--

Pilman assembles teams of experienced hikers teaming with amateur radio operators.

--

SOT1 IN Earl
OUT you're goin' out.

--
This search takes place at night. With temperatures in the 40s, three teams head out into the wilderness, maintaining a 2 meter contact with a Net Control at the park headquarters. Team members get a briefing on their missing person.
--
SOT2 IN There's a gentleman, he's about 28 years old
OUT at the marina
--
The sky is full of stars as teams walk up and down trails, looking for evidence of their target.
--
SOT4 IN We're starting out on the trail
OUT W4CUE
--
After about an hour and a half, one team finds its man and radios back in. The net closes, but only after each team arrives safely back at headquarters. Kenner Morrow is a naturalist with the Park:
--
BITE/KEENER IN The value is being able to coordinate
OUT there are any emergencies.
--
Ken Moore AB4WL, provided communications for one team. He calls it a rewarding experience.
--
BITE/MOORE IN Just bein' able to help
OUT participate and volunteer.
--
For Chuck Arthur, KF4SSX, tonight's exercise was his first search and rescue practice:
--
BITE/ARTHUR IN To me as an amateur
OUT into ham radio
--
In the past, these hikers and hams have helped search for missing adults and children during real emergencies, sometimes dealing with extreme cold and the hazards of rugged terrain at night. Tonight's drill went just about flawlessly. The people who took part in this event know they might get called again for real -- this night in the cold wilderness has helped them to be a little better prepared.

From Oak Mountain State Park, Alabama, I’m David Black , KB4KCH, for The Amateur Radio Newsline.

--

David says that the trail group usually holds two lost hiker searches every year.   (KB4KCH, ARNewsline(tm))

**

NEWSCAST CLOSE

With thanks to Alan Labs, Amateur News Weekly, AMSAT, the ARRL, the CGC

Communicator, CQ Magazine, the FCC, the Ohio Penn DX Bulletin, Radio Netherlands, Rain, the RSGB and Australia's Q-News, that's all from the Amateur Radio Newsline(tm). More information on contacting us is available at our only official website located at www.arnewsline.org.

Before we go a reminder from the ARRL that the deadline for nominations for the Hiram Percy Maxim Award is March 31st. Nominees must be age 21 or younger and hold a valid Amateur Radio license. The winner will receive a $1000 check. Full details are on the web at www.arrl.org.

For now, with Bill Pasternak, WA6ITF, at the editors desk, I'm Don Wilbanks, KC5MFA, saying 73, and we thank you for listening." Amateur Radio Newsline(tm) is Copyright 2002. All rights reserved.

Since you have a central point of control (the AP), why don't you simply run a master-slave protocol ?

And what happens when a single bit error form a sequence of 6 or more consecutive "1"s (an illegal sequence) or creates a sequence with 5 "1"s, in which case the following "0" bit is discarded as bit stuffing, thus upsetting the whole timing. With the timing out of synch, how do you handle the interleaving and ECC ?

>Optimized for 1200bps to 19200bps with up to 3 users per channel.

What bandwidth is required ? Does the signal contain a DC component ? Is equalisation required, is it implemented in the receiver only, how is the training sequence handled ?

What happens if an AP can hear a station communicating with an other AP on the same channel or an end user can hear two APs ? If call signs are not transmitted in every frame, how do you determine if the transmission is intended to your AP and not to the neighbour AP, but it happens to be received in the correct time slot ?

Paul OH3LWR

How does it work then?
Post some specifics.

> > Does it use some protocol other than AX.25?
>
> Doesn't use AX.25 at all.

What protocl does it use?

> > Does it use HDLC?
> > - Ok, it uses HDLC at layer 1.

Therefore there is no routing.

> > Is there a broadcast protocol?
>
> Not per se, the Access Points "broadcast" time slot allocations at
> fixed intervals, and users are expected not to interfere during these

> time periods.

How will they avoid interfering?
Tell us about the protocol.

> > How is station identification handled?
> > - You mentioned some ideas about how it might be handled.
> > - By noticing which slot is used.
> > - What did the FCC say about that?
>
> It meets the rules, so the FCC can't say jack.

You avoided my question again. The question was "How".

> > Is there an existing STA for this protocol?
>
> Doesn't need to be - because it won't be an autoforwarding system, in
> the old sense.

Will it transmit on Amateur frequencies?
Will it transmit data?
If so, it uses a protocol.
That protocol must be known to the FCC.
Have you filed the protocol specification with them yet?

> > Would it be a good protocol for weak signals?
>
> The are no design considerations for this - other than the fact that

"... will be ..."
So there is no protocol at all yet?

> > Would it be a good protocol for HF?
>
> No.

Why.

> > Can existing TNCs be retrofitted?
>

I didn't say that. Do you?

> > What are the requirements for the radios?
>
> Look at Part 97.

So it WILL work on HF!
Part 97 says HF can be used.

> > What speed do these requirements imply?
>
> Optimized for 1200bps to 19200bps with up to 3 users per channel.

Tell us about the channels.

> > Try and get this back on topic: tell us about the radio part.
>
> There is nothing to tell.

I think you meant to say "I have nothing developed yet."

> > Why is this "better" than what was done in Vancouver / Montreal prior to 1984?
>
> Because the applications have changed since 1984... and because we

We were talking networking, not applications. Try and stay on topic.

> have the Internet now... and because computers are about 10,000 times

We had the internet in 1984.

> faster now... and because we now have GPS position reporting... and

GPS position reporting is an application. Try and stay on topic.

> because handhelds can replace TNC CPU functionality... and because we

You said MURSLink uses TNCs.

> have Cable Modem's and DSL... the world is TOTALLY different... the
> only thing that has stayed the same is Shannon.

So MUSRLink is a scam to get people to buy MURS radios from you?

Hi name here is Les.  I bought a Kam + last Sunday at a local Hamfest but it
came with out a Manual.  It works, I can receive and transmit but only
because I found the pinout
designations on "the web" and had or made the cables necessary.

I would like a copy of the Manual if possible.   I will pay for copying and
mailing.  I tried Kantronics and they do not have any ? !

Please let me know.   E-mail :  kbtgw@ws.quik.com
                                      Phone : 516-295-0696

73 de Les,   K2TGW

If you are implying some form of handshaking, then that would imply
too much overhead.  The idea is to allow senders to have
reasonably(I'll go as far as to say optimally) sized transmission
windows to send their data - and to know when they can send, to avoid
collisions.

> >> Would it be a good protocol for weak signals?

Also, I might add - dynamic adjustment of error-correcting code
overhead can be used for noisier links - so I suppose the answer is
yes, too a degree... although I'm referrring more to noisy links, more
than weak signal links.

This is where the fun will really start in optimizing the protocol.

We were talking about HDLC support in the terms of KISS support on
existing TNCs... MURSlink doesn't have to be limited to layering on
top of KISS.

I'm not trying to redesign the Bell 202 Modem standard.

Multiple frequencies can be used to seperate AP honeycomb cells...
Four frequencies will provide large buffer areas.

Like the cell phone network design, the idea is to avoid this
situation like the plague... Remember; high-level/high-power APs are a
no-no in the cellular concept... (this is where a MURS implementation
helps - as everyone is limited to 2WERP... and hopefully is someone
puts an AP on a mountaintop, it is in a remote area.)

While I won't rule out that I might try to sell a radio or two(or
three); MURSlink won't help me much. I do intend to build a device
called a PubNode(which includes a modem and a microController), for
interfacing radios(MURS or Ham) to a portable device - but the price
will be reasonable, and available in kit form.

If you are really concerned with folks trying to SCAM hams with
digital snake oil, I suggest you concentrate your efforts on TAPR.

If you have fixed slots and only one out of three stations have anything to transmit, then the actual capacity is only 1/3 of the channel capacity. In a master-slave system you can poll stations that have been inactive for along time only infrequently (not every scan cycle) or you can include into the last acknowledge message to a previous station a poll command to the next station (e.g. by using broadcast frames), thus, not much extra overhead for polling.

The worst thing in AX.25 packet (after CSMA) is the very weak resistance to errors. A single bit error in a 2000 bit frame will cause a retransmission, upsetting the performance very badly. Even in a pure white Gaussian noise environment, quite high noise peaks can and will occur quite frequently. Thus, a quite high SNR (and thus high Tx powers) is needed to keep the BER in the order of 1E-4 to 1E-5 for reasonable performance. In VHF, the noise is not white, but also includes ignition peaks etc., requiring an even higher SNR.

If you are planning for a cellular network with frequent reuse of frequencies, it is essential to keep the transmitter power down and you must be able to work with low SNR and with the BER in the 1E-2 to 1E-3 region.

If you want cell frequency reuse, you must work with low SNR. This is important especially in areas where there are a lot of stations, i.e. urban areas.

If you only have three stations on each AP and only four frequencies, the system total capacity would be truly minimal, especially if such high powers as 2 Werp are used.

The essential thing in cellular network design is that you can control the transmission power in both direction so that the required SNR _and_nothing_more_ is obtained.

In the early 1980's we had here in the Nordic countries the NMT-450 analog cellular phone system with mobile and/or transportable phones. Despite 180 channels it became soon apparent that the cell size could not be reduced much less below 1 km along the main streets in larger cities, since the _minimum_ power setting of the phones was set too high in the specification. Thus, the NMT-900 network had to be started with a lower minimum power and more channels, quite a few years earlier than planned, to compensate for the lack of capacity along a few large streets in a few larger cities.

In order to be able to run a tight cellular network on ham bands, the other end of the link must be able to control your transmitter power. The minimum power setting from ham equipment vary very much from manufacturer to manufacturer and in many cases is also temperature dependent.

Thus only three stations on each AP is far too little, realistic figures would be 10 to 30 (from frequency reuse point of view), with most of them being inactive for a given time. How does the time slots work in this situation ?

Of course NOT. This is an auction, not a sale. If he can't even get that part
correctly stated, you must wonder what must be wrong with the unit.

The post, as stated, would be a violation of the charter for "rec.radio.sale"
since that requires auction notices to indicate "FA" or "Auction" in the
subject, let alone that he posted it to the wrong group.

I can see where you might imply that from the discussion so far... but
the idea would be that when a channel has only one user requesting
channel capacity, all three slots will be given to him. If a second
user requests channel capacity, the first user's capicity will drop to
two slots, and the new user will get one slot per epoch(and will get
all three when the first has finished his transfer).

With this system, the AP can handle channel management for all users
within his timeslot... no extra overhead(with the insidious
accompanying TxDelays) for talking to all the different users on the
channel.

It will be a piece of cake to improve on AX.25's resistance to errors.

There will have to be a reasonable balance set between error-resistance and error-resistance overhead... and I think the results of actual field experimentation statistics should be the guide.

Of course not. What I'm saying is that I'm not designing a modem.

Three stations at a time can transfer data, but many users can be on the channel - it is just that most of the time they won't be doing anything(they will be reading their e-mails between transfers, etc)... many more can be monitoring the position reporting data... we are talking hundreds of possible users in an urban/suburban surrounding... of course, if it gets TOO popular, we will have to petition the FCC for more frequencies :^)

I'm looking at more users than that... because many will be just getting position reports(a la APRS), and many will be sitting idle(reading/composing) their e-mail.

I think you are trying to be more ambitious than I am. I'm looking at what is optimally acheivable given today's off-the-shelf technology and plug-and-play radios, with the most useful applications(small to moderate size e-mails, and position reporting). I'm trying to be a realist... too many times I've seen hams go down the path of trying to shoot for the moon... and ending up with nothing.

To summarize: MURSlink is designed to optimize things for the most useful portable applications(e-mail and position reporting), using existing inexpensive off-the-shelf two-way radio technology.

The key to this approach is that MURS radio prices will need to drop to about the same price as FRS radios... so far, we haven't been seeing this happen... but MURS is still in its infancy, and all signs point to an increase in consumer awareness and manufacturer commitments to MURS.

The way I see things happening is that initially, only ham-types will be interested in MURSlink - especially in the field experimentation stage, where they can help set the protocol design parameters. But, once MURS begins to "go consumer", and things start to expand among the Wal-Mart crowd on the MURS frequencies... only then will the general ham population become interested in MURSlink.

The important thing is to have a viable protocol available in time for the MURS consumer explosion - otherwise digital users will lose out on "staking their claims" to the unused MURS frequencies.

Not to mention the fact that the current bid  is  $78 (reserve not met) :-)
I'd buy it for $75 or less, but won't even bother to put in a bid with an
unknown reserve. Looks like it is probably a 9612+ though, and that
would be worth more than $78. Doesn't say what firmware either,
another issue.

So just a suggestion David: say which firmware and which
exact model of the 9612 ... you might attract more interest.

Of course I already saw it in my morning check of eBay ...

I scrounged up a computer, have it on my workbench in the next room, connected to the internet. It's running Windows 98, but can just as well run Red Hat or FreeBSD or whatever. Pentium 200, 6 GB disk drive, AWE64 sound card, two serial ports, parallel port. Have two more similar machines sitting on the shelf, if I need more than one computer to do the tests.

Also scrounged up two 2M radios (mobiles, but can come up with HTs if required), and two TNCs (one MFJ-1270B, one Tasco uTNC21 which is a TNC2 clone). Also have feedline, antennas, power supplies.

Also have a pair of TEKK KS-900s available, along with antennas and feedline for testing on 70 cm at 9600 baud or above. Have a spare Data Engine with 9600/19200 modems, and a spare KPC-9612.

All of the above has been tested and is working.
I have some spare time.

So I'd like to try out MURSLink, running the above gear into dummy loads, or into actual antennas if MURSLink is in fact allowed to run on the Ham bands.

Where do I download the software?

If there is no software, I'm a reasonably good programmer (40 years experience) and can write my own. In this case, where to I download the specification(s)?

I'm ready to give it a try and see if it lives up to the hype.

I mentioned the concept to a bunch of folks I regularly chat with on HF, and there was a fair amount of interest.

Several are retired Hams within VHF range that have the gear and time
available.
Another is 2000 miles from here, and is interested in testing it on HF
(ten meters where we can run 1200 baud). She has several Macs
but no PCs, will that be a problem?

From the looks of the posts in this newsgroup, this looks like a good
place to ask this question.

I have aTS-440sat and am feeding the external speaker o/p to my sound
card so I can do psk31. I would like to be able to feed the audio to
my pk232 so I can use it for pactor and other modes as well. How can I
do this and feed a speaker as well without overloading my audio driver
on the 440?
thanks

John,ve3sjv

Hardly "angry" ... we just figure that folks who post
here should follow the rules ... and if they really really
feel they need to break those rules, then they should
not misrepresent an "auction" as a "sale".

So we give 'em a hard time.

What IS the reserve, by the way?

Wow, this sounds like an interesting project.   You desiging a satellite, huh?
Is there a chance this would actually get launched?
Just wondering, have you decided what kind of computer to put on there yet? There are
tiny modems for 9600 baud packet, but they are a bit of the CPU hogs -- from what I've seen.

(Hi guys, I've been away programming constantly since like November of last year. Just
shipped off final code a few days back.)

Is it possible to run ritty or bitty in toshiba satellite pro 480cdt with a yamaha opl3-sa3 soundcard?
I have try and try, but no, it transmits ok, but doesn't receive nothing...

aarrg.

This is equivalent to my ham equipment repository. I've also got a 36
ft. tower/antenna, and a couple of moderm narrow-band commercial VHF
radios

I've have a mailbox set up, and am doing AX.25 beaconing on MURS on
151.940Mhz.

> All of the above has been tested and is working.
> I have some spare time.

This is something I don't have a lot of... I'm a Systems Engineer by day, and am working on this in my off hours... which amounts to a second full-time job.

> So I'd like to try out MURSLink, running the above gear into

Are you at all interested in C# or .NET? This is my development environment for both the AP and PDA-based software.

> I'm ready to give it a try and see if it lives up to the hype.

> but no PCs, will that be a problem?

I'm designing for .NET-based targets, with a single development environment for both the PDA and AP software (Visual Studio.NET or Visual C#.NET is preferred). While free command-line versions are available from Microsoft, the Visual environments are vastly superior, for a number of reasons(debug support, Wireless development environments, etc.). Linux and Palm environments were considered, but have been ruled out for various reasons. I have not looked at the Macintosh enviroment at all.

I'm currently concentrating on the map-based portion of the software(which is used for position-reporting, but will also provide a snazzy user interface background for both the AP and PDA-based applications) . The proposed baseline standards are CADRG and GeoTIFF. Here are links where specifications for these standards can be downloaded:

http://164.214.2.59/publications/specs/printed/CADRG/cadrg.html

http://remotesensing.org/geotiff/spec/geotiffhome.html

I am not familar with those programs. Go here and download MMTTY and see if it will run . It is a free sound card program.

http://www.muenster.de/%7Ewelp/sb.htm

I have ran this one on several computers with poor sound cards and it works very well. It does have a monitor screen so that you can see the audio coming in. Do have this in the above programs and can you see anything on it. That will tell yo that you are getting audio into the program. You may not have the aduio in for the sound card emabled. Is anything at all printing on the screen ? Even just leters that do not make sense ? Not sure how you have it set but you do need to have the ssb receiver in the correct mode, usb or lsb depending on if the softwear is set for normal or reverse and the baud rate should be about 45.45 or 60 WPM and 170 hz shift for most ham transmissions. You should be able to here the bullitens of W1AW on the scheduled times that are posted at arrl.com. This will show you what the RTTY should sound like.

If you have not tried RTTY before it can be confusing on how to set up the program so it will work for you and to correctly tune in the signal.

Perhaps I was not very clear.

I'm not interested in the applications until I have seen the protocol
in action and working. i.e. the underlying stuff that is supposed
to be better than AX.25.

Have many different application development environments
available, including C++/C#/.NET (Visual Studio), Borland 4,
Linux, several DOS based (Aztec, old Borland, old Microsoft).

But first the basic stuff: one TNC talking to another.
If that's AX.25 ... then there isn't anything of interest to me.
"Been there, done that."

Let's see: He's spamming us with "MURSLink" and now he admits he's using
AX.25, not MURSLink, on his MURS allocation.....

I have to give him credit for this one: He's proven that he's more than the
idiot we concluded here that he was.... He's an idiot AND a hypocrite.

Is the impedance of either the sound card or the pk232 input low enough to make
this an issue?  I haven't tried it, but I would've assumed not.

I stuck a y-jack after my sound card and feed both the speaker
and the PK-232/PSK.  Maybe I'm bad for not worrying about impedance and
all that, but it does seem to just work.  I don't think you're gonna'
break anything by just plugging it all together and seeing what happens.

Many thanks to all who have taken the time to read this message.
I have an old 486x33 Mitac laptop, I use in my mobile home to run packet
radio.
```

Recently the hard drive went down, fortunately I was given another drive, of different manufacture and size.
My problem was accessing the bios to change the drive data.
In the end I unsoldered the battery, this then told me the real time had failed, and then allowed me to change the drive data.

What I want to know is there a procedure to get into the unit at boot, or do I need a disk like used to be used on the old 286's with Phoenix bios.

Any suggestions would be appreciated.

Best regards

John Couch vk3jd

If it is really transmitting, it should receive as well. Check to be sure you have the
right amount of audio into the correct soundcard port.

After following the discussion for a few days, it much sounds like "in
development" actually means that the originally sketched on a napkin
has been redrawn on napkin number 2 :-).

There is still a long way from something outlined on a napkin to a
specification that would come to the same level of functionality as
even AX.25.

Hi folks... Anyone here using Hamtext for Commodore computers for
RTTY?

I'm playing around with it, and have no documentation, yet several
questions/problems...   Can anyone assist?

TIA!

I don't think audio is in the spec, since the only URLs
given pointed to some TIFF style file formats :-)

However, it should be simple enough to do streaming ra.
At 1200 baud, streaming ra should be good enough for CW
at least, probably 45 baud RTTY as well.

Hi Cathryn,

There's about a 90% chance this one will get launched. I'm working with the Cornell University CubeSat project; we already have a launch slot and funding etc. All that's left is to build the sat! Web page for the project is at http://www.msae.cornell.edu/cubesat if you want to look at it. Of course the site is behind development quite a bit, but you'll get the idea.

There will be several CPUs on board. One on the Cougar GPS receiver, one on the TattleTale board which is for command & data handling, and one on the comm system handling modem & TNC duties. The comm system should be pretty nice, all on one board about 9x5 cm. Presuming it gets finished wihtout major obstacles preventing it of course!

I'm doing backup research right now for comm in case the primary design fails. Sad thought, but in the world of students anything's possible.

73, Mike N2VR

Hello,

I've been looking for a good download site for the APRS+SA software. The URL on www.tapr.org doesn't seem to work and all the other sites that come up on yahoo just have links to tapr's web site. Could someone help me out?

Thanks,

Rob Ramsey

If you want a great APRS program that works with Street
Atlas, get UI-View32. I think it costs about $20.

Is TAPR still in business? I haven't heard anything about their
Spread Spectrum radio in a year now. Guess it takes a

while to close down a project :-)

Well, there's gotta be someone there. I ordered a bunch of equipment and a membership from them around December.

I received everything, equipment-wise, but I've yet to see any sort of membership card or mailings (assuming they generate such -- they may not), but their degree of communication leaves a bit to be desired. It took three phone calls and an E-mail before I finally got the UPS tracking number from them.

I just now tried this link:

http://www.tapr.org/~kh2z/aprsplus/

And it worked fine. Comes right up with all the info.

Good luck.

I am a registered user of XPWin, my favorite digital mode program.

Unfortunately, I am unable to find a place to download the program following a hard disk re-build.

Where is the download site for KF7XP's great XPWare program for windows?

```
Thanks, Brian

you can try http://www.goodnet.com/~gjohnson
However I was unable to reach the server. It could be down at this time,
but it is worth th try.

I have been trying that address for weeks.

I also tried Google search.

Still, no joy.

Hi Brian,

I recommended this software to someone recently and he told me that all the links he followed to try and find it led nowhere, so I sent him a back-up copy I had. If you don't locate the site let me know and I'll mail it to you.

Regards

Besser Associates is offering their acclaimed "DSP Made Simple for Engineers" class in Mountain View, CA on 6-8 May 2002.

This 3-day class is particularly well-suited to those involved in RF and Audio signal processing, and computer programmers, who need to learn the fundamentals of DSP. Details of this course, including target audience, learning objectives, course outline, materials descriptions, and past student comments are appended to this posting as items "A" to "I".

SALE ENDS SOON: For people registering and sending payment by March 1st, the cost of the course is reduced by more than %50 to $500.

To register, please contact Besser Associates at 650-949-3300. For additional course offerings, please call Besser Associates or visit http://www.bessercourse.com/ to view our public course catalog and current schedule.

------detailed course information follows------

A. BESSER COURSE TITLE:

"DSP Made Simple"; a 3-day tutorial course on digital signal processing (DSP).

B. TARGET AUDIENCE

- The primary audience is practicing RF (and Audio) hardware Engineers and Technicians who need to understand digital signal processing (DSP) because of its ever-increasing role in the processing of real-world signals.

- While DSP Made Simple is not a "programming course", it is particularly well suited for computer programmers because of their increasing need to understand DSP algorithms.

- In general, this course is beneficial to anyone involved in the acquisition, generation, transmission, manipulation, or analysis of signals.

C. WHAT THE STUDENT GAINS FROM THE COURSE:

- The ability to apply DSP techniques to real-world signal processing problems in their work.

- A solid grasp of DSP basics and the ability to move gradually to more sophisticated DSP concepts and applications.

- The ability to speak the language of DSP.

- The ability to understand written descriptions (articles, application notes, textbooks) of DSP methods used in practice.

To register, please contact Besser Associates at 650-949-3300.
For additional course offerings, please call Besser Associates
or visit http://www.bessercourse.com/

D. COURSE OUTLINE

____

DAY 1

DISCRETE SEQUENCES AND SYSTEMS

- Discrete Sequences, Their Notation, and Representation
- Signal Amplitude, Magnitude, Power Definitions
- Signal Processing Operational Symbols

PERIODIC SAMPLING

- Periodic Sampling and Aliasing
- Sampling Low-Pass Signals

* Sampling Bandpass Signals
* Spectral Inversion in Bandpass Sampling

THE DISCRETE FOURIER TRANSFORM
* Understanding the DFT Equation
* DFT Properties
* Shifting Theorem
* Inverse DFT
* DFT Leakage
* Use of Windows
* DFT Results Interpretation

____

DAY 2
THE FAST FOURIER TRANSFORM
* Relationship of the FFT to the DFT
* Hints On Using FFTs With Real-World Signals
* FFT Input/Output Data Index Bit Reversal
* FFT Software Availability

FINITE IMPULSE RESPONSE DIGITAL FILTERS
* An Introduction to Finite Impulse Response Filters
* Convolution In FIR Filters
* FIR Filter Analysis and Design Examples
* Half-Band FIR Filters
* Phase Response of FIR Filters (Group Delay)

INFINITE IMPULSE RESPONSE DIGITAL FILTERS
* An Introduction to Infinite Impulse Response Filters
* The Laplace Transform
* The z-Transform
* IIR Filter Design and Analysis Methods
* Pitfalls in Building IIR Digital Filters
* Cascade and Parallel Combinations of Digital Filters
* Comparison of IIR and FIR Filters

____

DAY 3
ADVANCED SAMPLING
* Quadrature Signals and Quadrature Sampling
* Quadrature Sampling With Digital Mixing
* Digital Resampling
* Decimation
* Interpolation
* Decimation and Interpolation in Combination

QUANTIZATION and A/D Converters
* Finite Word Length Effects
* A/D Converter Operation
* Effective Bits
* Improving A/D Performance
* A/D Converter References and Internet Sites

ADDITIONAL TOPICS (If We Have Time)
* Reconstructing a Continuous Signal
* D/A Converters
* Floating Point Number Formats
* Block Floating Point Number Format
* Matched Filters

E. WHAT THE COURSE DOES NOT COVER:

The DSP Made Simple Course does not cover the hardware architecture of commercial DSP integrated circuits. Likewise, while the course introduces the topic of commercially available DSP design software packages, no computer programming is performed as part of the course.

To register, please contact Besser Associates at 650-949-3300. For additional course offerings, please call Besser Associates or visit http://www.bessercourse.com/

F. COURSE HANDOUT MATERIAL

* The training material comprises 475 pages of class handouts. With the typical lecturer, the student must decide between taking notes, or paying attention to what the lecturer is saying. The training handout solves this "note-taking" dilemma. The DSP Made Simple training material provides a "bulletized" description of each DSP topic in addition to an abundance of diagrams. A textual description summarizing the key DSP concepts are included at the bottom of each handout page.

* The book "Understanding Digital Signal Processing", written by the instructor and published by Prentice Hall. (This text is Amazon.com's top-selling DSP book.)

* Pertinent DSP documents, such as tutorial articles on DSP, lists of DSP-related Internet sites, vendor application notes, etc.

G. COURSE LECTURER:

RICHARD LYONS is a Consulting Systems Engineer and lecturer with Besser Associates in Mt. View, CA. He has been the Lead Hardware Engineer for numerous multi-million dollar signal processing systems for both the National Security Agency (NSA) and TRW Inc. An experienced lecturer, and instructor at the University of California Santa Cruz Extension, Richard has delivered signal processing seminars and training courses throughout the US and Europe. He has written numerous articles on DSP topics, and authored the best selling textbook "Understanding Digital Signal Processing". Richard is a member of the IEEE, Eta Kappa Nu the electrical engineering honor society. He can be contacted at: ricklyon@onemain.com

To register, please contact Besser Associates at 650-949-3300.
For additional course offerings, please call Besser Associates
or visit http://www.bessercourse.com/

H. WHAT'S GOOD ABOUT THE COURSE

- Instead of overwhelming the student with complex mathematics, the lecturer uses intuitive explanations and well-chosen examples to develop a fundamental understanding of DSP theory. (A recipe for technical material that's too rich in equations is hard for the beginner to digest.)

- The practical aspects of signal processing techniques are stressed as opposed to mathematically rigorous discussions of discrete system theory. THIS COURSE TEACHES THE STUDENTS HOW TO USE DSP IN THEIR WORK.

- Comprehensive in scope, and gentle in approach, the course gives the student a thorough grasp of the basics and the ability to move on to more sophisticated DSP concepts and applications.

- In addition to covering the key practical aspects of DSP, a collection of tricks-of-the-trade used by DSP professionals, to make their processing more efficient, are introduced throughout the course.

- In terms of DSP training, this course is the beginner's best opportunity to efficiently and thoroughly learn the fundamentals of DSP.

I. QUOTES FROM RECENT STUDENTS:

"Excellent course for engineers wanting to get (an) insight into DSP."
- George Hughes, Lockheed Martin

"This course takes the mystery out of DSP. Rick has a knack for presenting information in a way that is very logical and easy to understand."
- Dale Laing, Lockheed Martin

"Lyons presents a very solid engineering perspective of the subject with a minimal, yet sufficient, amount of math."
- Gene Kozin, Itron Inc.

"Lyons' is an excellent communicator of highly technical material. He uses plenty of real examples to translate theory to something of utility."
- David Day, Day Test and Measurement Inc.

To register, please contact Besser Associates at 650-949-3300.
For additional course offerings, please call Besser Associates
or visit http://www.bessercourse.com/ to view our public course

catalog and current schedule.

You know, it seemed to me that there was no reason why MURS digital experimenters/impementers and Amateur experimenters/implementers couldn't get along together on this group.

However, I've got a lot more important things to do than banter over this issue. So, I've been working on creating a Usenet Newsgroup for MURS. However, these things just don't happen overnight, so until it gets off the ground, this is still the most appropriate group to discuss packet radio digital experimentation on MURS. Additionally, it also seems to be the appropriate venue to announce this "branching off" of the "non-amateurs" (professionals?) from the "amateurs".

MURS is much more like CB than like Amateur Radio.

Please go post to that group, you might get better reception
(pun intended).

He has a very long history of posting off topic trolls
and spam to this group in particular. So it's kinda fun
to jump on him and watch him squirm ... he never
misses a beat, always rises to the bait and takes it!

While I mostly agree with your statement, I'd like to add that MURS
was derived from 5 old business band frequencies, and tends to have a
more "business-like" slant to it than 11m CB.

> If the MURS guy wants to share
> something with the news group then why not let him?

I should mention that I'm not just a MURS guy, my ham callsign is
N0MHS.

> Just relax. Maybe he has something to share that someone else might want.

Absolutely. However, I've found that those that have an old grudge
against Internet-backboning are not going to have their attitudes
easily changed. As ludicrous as it sounds, they will not give up on
the idea that everyone must go back to HF-backboning... it is kind of
like the Morse Code debate - old habits and attitudes die hard in the
Amateur Service.

Try wrapping several turns on a torroid on both the power cable to the RX
and the audio cable between the RX and the PC - do it close to the point
where the cable meets the RX. This worked fine for me using a Yaesu
FRG-100 with a standard (relatively) cheap PC. Also, make sure that your
antenna is as far away from the PC as possible - my antennas are in the roof
space and I get bad QRM if there is any PC switched on in the upper floor
of the house - much less if the PC is on the ground floor.

If you have strong interference on specific frequencies which are important
to you (I had a strong beat right on top of 14.230 - sstv), try changing
your screen resolution or scan rate - that will usually move the frequency
of the radiated signals from the monitor!

A ham just gave me a PK88 but I did not get any documentation. Can anyone please
tell me the pin assignments on
the front panel connector so that I can build a cable for the TNC?

Thanks,

Duffy

No...jealous. Doesnt have the knowledge, resourses, money, and/or
equipment to make it happen, so he bashes those who do.

Typical double-digit IQ response...   :)

Correct. This group was hijacked by the BBS people years ago. All
the real experimenters are on mailing lists. Anything that goes on here
is completely dysfunctional.

Before BBS there was mostly NOS users here. So what I find especially
hilarious, is Hank AKA Tubby trying to distribute his SNOS without
source code. He says he's fixing all the code, because he's a much
better programmer than all the rest.

Some things come full circle in a short amount of time. But Amateur Radio
is as dead in America, as the Hula Hoop.

I'm the same way with my cell phone. I bought this cell phone, and
all it does is ring, and when I answer it, all I can do is talk into it and
hear other people. Am I missing something? Is this all there is?

> There just seems to be absolutely no communications.

Define communications. If all those APRS packets are beaconing data,
isn't that communications?

> Check out TNOS, I think it has NET/ROM support.

NET/ROM you have in kernel as part of AX25 support.

Try to ge loopham distribution and see how things are set-up there.

Or you can always run dosemu and patch KISS trhough pipe in dosemu
serial port emulation (tested - works like charm). Just ttyp?? <> pty??
or something like that pairs.

True problem with PC.
Apple hardware behaves but does not have so much packet software
availabe...

And for most things old PPCs would suffice.

The only "history" I recall is attempting discussion of
Internet-backboned systems(on both ARS and MURS), while having to fend
off a couple of bitter old coots from Oregon and Texas who seem to
want to take things back to the "good old days" of HF-backbones and
PBBS systems.

Oh, by the way, I'm still pursuing an alt.radio.murs newsgroup, if
that makes you feel any better.

Steve has intuitively invoked an important axiom of information theory:
If the data sent has no value to any recipient then it is "noise", not
communications. What is the value of "seeing a lot of APRS stations that
come up on the screen, both mobiles and fixed stations"? Beat's me! I
guess that, like beauty, its value is in the eye of the beholder.

This question makes no sense, but then again, it's coming from Stewart, so why
should it?  How does one "run MURS on the ham bands?"  MURS has its own
frequencies....

If you find out anything, please let me know.
As a card carrying member of the anti-Windows-based-on-technical-merit
club I want it ported to Linux. Even want to do it myself. But, you need
the specifications in order to do it.

"no value to any recipient" is where we disagree.  Sure it has no value
to many, but if it has value to even one, then it is not "noise."

APRS is exactly the same as military TADIL-A (and B)  was from 1954 to
about 1995.  The military is moving to Spread Spectrum and JTIDS, but
the basics are still the same.  Moving and fixed stations are plotted on the
display, and also special points and vectors are drawn.  For example,
multiple vectors to a jammer that can be triangulated, etc.

Hams being basically stupid, have only used about 10% of the capability
that APRS would provide.  Out in the midwest you can see where all the
tornado's are, because all the storm trackers GPS their position and
weather reports.
```

Open your fucking mind.

Coming from Stewart????? Stussy, I've always wondered where you were
coming from when you were speaking to me... I always felt that you
were mixing me up with someone else. Now it is perfectly clear that
you ARE mixing me up with someone else.

Eh what? Was mostly RTTY, then AX.25, then BBS ... and then
later on the NOS folks were here, now any technical or operational
discussion has moved elsewhere due to all the non-ham crap.

Try asking for help testing a new mode or new protocol ...
... most of the responses run along the lines of "Why would
you use Ham Radio when you have the internet."

> So what I find especially
> hilarious, is Hank AKA Tubby trying to distribute his SNOS without

Wow are you confused!
You want to try SNOS, you have to beg for it.

You are very very confused.
We would like to use ham radio.
It's that simple.

> Oh, by the way, I'm still pursuing an alt.radio.murs newsgroup, if

I asked you earlier in this thread to share the technical details
of your proposed MURSLink service. Care to do so?

Is there a spec?
Is there an open source project?
Will it run at reasonable speed (> 19k2)?
Post a URL?

So far ya nothing but hot air about some commercial
stuff you think you might maybe wanna do ... if you
can convince enough hams to do it on commercial
frequencies instead of on ham radio. So tell us what
is new interesting and different about this wonderful
stuff, other than it allows you to make money.

Your name does appear in the above-quoted stack of messages, doesn't it?

All this proves is that we know that ANY of this MURS drivel on this newsgroup
is all Stewart Teaze's fault. It certainly proves that I think such, and I
will leave it as "an exercise for the reader" to demonstrate that others (such
as Hank) think so too.

While we're on the topic of APRS, I will be getting into Packet by April/May as
I move into my new house. I have no desire to have my house shown on any APRS
screens, and I even use a PO Box on my ticket. Will running a packet station
automatically subject me to being shown on APRS screens, or do I need to be
running special software in order to be displayed?

I was wondering if I-Link had anything to do with IRLP, as I mentioned in an earlier posting in this thread. I took a look and found that IRLP is based on SpeakFreely, which is an open-source Internet phone program that I've also known about for some time. Long story short, looking that the SpeakFreely code, it appears that IRLP is SpeakFreely but using different, and previously mentioned, port numbers.

So, at least part of the mystery of I-Link seems to be uncovered.

Lets look at Ham Radio in the big picture. When I talk about Ham with people
outside the hobby

but work in electronics engineering (my career field). The first thing they mention is alot of people running around the handheld radios strapped on looking like the Frito Bandito with microphones criscrossing their chests. Those that have listened either with scanners or overheard the communications of said Frito Banditos, always comment upon the trival and non-important topics of discussion they have heard. For example, someone using the auto-patch to call home while only a block away from home to inquire if the XYL needs "a loaf of bread" or some other small and trival item.

In the big scheme of life people get different things from their hobbys. I got into APRS because it helps me explore how a system similar to the commerical version Vehicle Locator and ID system works. This helps me understand what our customers are up against when we need to design a an antenna system supporting their VHF communications.

My point is Ham Radio is alot of on the surface trival bull shit that if explored has meaning to someone. Just because one person does not benfit nor understand what come out of it does not mean someone else can not.

APRS users transmit lat/lon information (using GPS
when mobile). They don't really associate with people
who are hiding or crouched in one corner of their house
as society moves on around them.

How do you think your house is going to appear on someone's APRS screen,
unless you *choose* to transmit its location?

I dunno, that's why I wanted to ask. I thought perhaps while I was engaged in
packet activity, that APRS was able to show locations of stations transmiting
on packet. Apparently I was mistaken. Like I said, I am just getting into
packet and don't know a whole lot about it.

Well I didnt look you up on QRZ, but I did go to your WEB Page. I what do I
find under your Rigs Section:
"Cobra 142 CB radio - Covers the standard 40 CB channels, AM/SSB modes, hooked
up to an Imax 2000 vertical antenna"
Just as I thought another Cber with a CBpluser License.
 And by the way your Picture is dorkee looking.

When you transmit, on any band, one can DF you and find
out exactly where you are located. When you choose to use
radio (Ham, CB, MURS, whatever) your location WILL be
known to anyone who really wants to find out.

So what is the Big Deal if it does, are you in the Secret Service, or a Spy, or
in the Wittness Protection Program or what?

Packet is just another form of communication. APRS requires that you
have a GPS connected to your radio so that you can transmit your exact
location. Very useful if you are lost in the mountains and can reach
a repeater.

After a quick look at the site, he is in the Army most likely with a Communication or Intel Unit. I would lean toward being in an Intel Unit as his list of duty posts include Ft. Campbell (home of the 82nd Airborne), Ft. Belvoir (Home of Enginnering school) and Korea (the last bastion of real communist activity is the Far East right now). He Lives (or use to live on base) on base at Ft. Monmouth and doesnt want to transmit his LAT/LON in fear of targeting information being provided to the enemies of the U.S. Army or compromising his security clearence. He hails from New England area most likely Rhode Island and is of Anglo-Saxon or Cletic heritage best guess would from Wales or western UK judging from the last name and facial structure from what can be seen in the picture.

As casual observer I gleaned all this intellligence from his web site or at least this is the image project by that data.

Bun, James Bun......Agent 001 and I have a licence to bore! I like mine mixed in a cement mixe not stirred.........

Here's the pride of Covington, Louisiana (from QRZ):

BRUCE A BEYNON
 804 W 12TH AVE
COVINGTON, LA 70433
 (985) 893-7227

Biography Info:

One of the only Real Hams left, most of the new ones are CBplussers

What a sad excuse for an Amateur Radio Operator.  Just despicable.

From what I can tell, there were only two folks complaining about the
MURS thread about MURSlink Internet-backboned packet experimentation.

With only one last person left complaining specifically against
Internet-backboned systems - perhaps there is hope yet to improve on
AX.25 in the Amateur Service. To appease those(Stussy) who felt that
the original thread about packet experimentation specifically on MURS
was not relevant to this group, it is best that the name of the thread
be changed to MURSlink packet experimentation on ARS frequencies.

It turns out that MURSlink will work equally well on ARS frequencies;
so the specific discussion of MURS is irrelavant.

One area where MURSlink is designed to optimize thruput vs. AX.25, is
in regards to routing protocol and station identification. MURSlink
uses a time-slot allocation scheme that supports up to three
simultaneous "users" from each Internet-backboned "access point"(AP).
As routing is no longer handled at the RF-layer, the incessant
transfer of "to" and "from" ID fields can be eliminated.   But, the
FCC Part 97 regulations still require that an Amateur station ID
itself at least once every 10 minutes, and at the end of every

communication. Let's look at an example of how station identification would work with MURSlink. The two main services provided by MURSlink are e-mail transfers, and position location reporting. For example, when sending e-mail, users request access to the network by transmitting an E-mail Transmission Request(ETReq) message, which provides the size of the e-mail to be sent(currently proposed limit is 8Kb). The ETReq message includes a station identification field, which could be an Amateur Radio Service callsign. No other explicit station identification will be made thru the protocaol during the ensuing transfer - however, station identification will be implied by the time slot allocations made by the AP. In any event, by limiting the size of the transfer, the 10 minute identification requirement can be met explicitly. To help meet the ARS requirement to provide station identification at the end of any communication, the user must include his or her callsign as the very last piece of text in the transmitted e-mail. At fist glance, it might appear that this last requirement should not be actually necessary, as the station identification can be implied by the time slot. However, for a station monitoring the transfer, who wishes to identify the user station, but who began monitoring the communication during the middle of transfer, he would need to have this ID present to determine the sender.

Now I'm confused again. You talk about radio, then
you instantly shift to talking about land lines. Try and
keep to the topic: radio.

> To appease those(Stussy) who felt that

I agreed with him.

> the original thread about packet experimentation specifically on MURS

> be changed to MURSlink packet experimentation on ARS frequencies.

Where is the spec?

I keep asking, so we can have an actual technical discussion.

How does MURSLink work?
Does it use some protocol other than AX.25?
Does it use HDLC?
What does it provide at layers 3 and 4?
Is there a broadcast protocol?
How is station identification handled?
Is there an existing STA for this protocol?
Would it be a good protocol for weak signals?
Would it be a good protocol for HF?
Can existing TNCs be retrofitted?

Is there a software implementation a la Baycom?

Try and get this back on topic: tell us about the radio part.

Linking radios via land lines is trivial and has been done
for decades. That part is obvious ... the radio part is interesting.

Just some clairifications - Ft Monmouth really isn't much of an Army post anymore, with it's roughly 100 or so active duty soldiers there, not including the National Guard infantry unit temporarily actived. It's more like federal installation with large civilian employee population and tenant activities. There's only a small MI detachment there and no, I'm not in the Army. Ft Campbell is home to the 101st Airborn Division (Air Assault), not the 82nd and Ft Belvoir hasn't been home to the Engineers in a couple of decades. I've never lived on post and I don't hail from New England, although my father's side of the family is from Mass. Just to clairify, I do work for the federal government, but in a position in which I would prefer not to have my actual QTH published. WA8ULX is just a delusional, wrinkled old man with no life, no family and no friends and is just jealous of young, handsome young men with more than he will ever achieve in the short period of time that he has left in this world.

A change in name does not make for a change in topic. Anything to do with MURS is inappropriate for an amateur radio group. By citing the above reason, the only thing you have done is proven to the rest of us (to the extent that we didn't already konw) what an idiot you really are.

Poor guy is just trying to promote his business.

If it has some relation to Amateur Radio, this is a reasonable
group to get some discussion going. It's still SPAM, but at
least would have some relation to this newsgroup.

Let's see if he provides answers to any of my questions.

I'm looking at the Tekk KS-1000 radio for the onboard end of a satellite
system. Obviously, this package needs an external modem before it's a complete
system. Anyone have any recommendations and/or with a very small modem design,
or even one we might be able to simply purchase for use with this radio?
Weight and power draw are of course critical, so the smaller the better.

Additionally, any hints, tips or tricks with the KS-1000, 900 series etc would
also be greatly appreciated.

Thanks, Mike

>What a sad excuse for an Amateur Radio Operator.  Just despicable.

Unfortunatly there's no personality test for a ham license. He probably spends
much of his operating time on 160 meters with the other grouchy old men.

You're right, I may never get to go to 160 meters and cry about the failure of ham radio since I choose not to upgrade.

That would be real nice if they just gave away the licenses, but they don't, so I choose not to upgrade. What do I get if I do? To enjoy the new frequencies, I'd have to buy an HF rig, antenna, tuner, etc... find the space to put the antenna on the roof, and the end result would be talking to stations in far off lands that I'll never meet or know. Oh, forgot - I could talk to a bunch of grouchy old men on 160 meters.

On the flip side, with 6m on up, I talk to a lot of the locals, whom I get to know via the radio. I am also expanding (as evidenced in the original message of mine) into Packet, which is another aspect that I can get into with my current privilages.

So tell me, what does "upgrading" (if you want to call it "up"grading) have to offer me?

I don't see how this MURS discussion is relevant to this newsgroup,
unless the devices are easily converted to 2m and we are just waiting
for some big MURS manufacturer or retailer to go bankrupt or withdraw
from the market and dump a lot surplus equipment to the market or
waiting for the current MURS users to sell their system for a low
price.

Without a protocol specification, this sounds just like any vapourware
"product".

I have nothing against replacing the X.25 derived CSMA protocol
(AX.25) with something more sensible radio protocol, but a proprietary
or vapourware specification does not help a lot.

The whole "upgrade" thing was a disaster brought on by the ARRL. If anything, Ham radio needs one level. You are either a Ham, or you are not. Seeing that most people do not understand electricity today, I would have a high voltage endorsement. We do that sorta, by having the HF license. But rather than just test for electricity knowledge that can kill you and your neighbors, we throw in Morse Code.

Morse Code is a lot of fun to someone my age, because it was used widely. It makes no sense today, as the only people who use Morse Code today, are intel agencies of various governments, to send 5 letter code groups.

Most clubs have multiple levels of membership. It's supposed to keep the interest up. That is, no one want to remain a first degree, they want to be a high-order illuminati. Well Ham Radio's illuminati is a this supposed "magical" thing called Morse Code. There just wasn't anything else available. Today, the club would have ASCII as the discriminator, I'm sure. You have to remember that people who were kids in the 50's and 60's were from a different era. They would pee all over themselves to get an 11 tube TV, instead of a 10 tube. I remember my dad peeing all over himself when they made washing machines for home use. I also remember blacks riding in the back of the bus, and making them use the outhouse instead of indoor plumbing. It was a very sad time in our history, but people like ULX really liked putting the sheet on and going to the Klub meetings.

I have gotten pactor working on my Drake 2-B (and SB-401 tx).

Here's the scoop, for anyone curious.

The schematic showed a 2M pot and 680k resistor from the agc (avc) line to ground to bleed off the agc "charge". The pot is labeled "bias adj" on the schematic and "receiver sensitivity" on the rear panel where it is located. Turning that from midway to zero sped up the agc considerably (as well as boosting the s readings, not that that matters much).

I also hooked up my old homebrew rtty demod which has mark and space filters and connections for a monitor scope. I consider this a necessity for working pactor with separate tx and rx. The freq adjustments are just too touchy, and the older tx and rx drift more than the new digital tcvrs (I'm sure). This is espcially true for connecting to the bulletin boards. I'm using a freq counter to get the tx in the right place, but using the kam display to get the receiver in the right place is not accurate enough (I don't think).

Anyway, thanks for the hint to look at the agc and see if the "fast" agc could be made faster!!!

dave allen, wb0taq, colorado springs

MURSlink is simply a protocol - designed for slower speed(<19.2Kbps)
RF links; such as MURS or ARS 2m.

> Without a protocol specification, this sounds just like any vapourware
> "product".

I prefer "in development" to "vaporware".

> I have nothing against replacing the X.25 derived CSMA protocol
> (AX.25) with something more sensible radio protocol, but a proprietary
> or vapourware specification does not help a lot.

MURSlink will NOT be proprietary. MURSlink can be run over any
KISS-mode TNC or SoundCard - but for PDA applications, it will work
better thru a PubCel MURSnode :)

Greetings,

We have started a Radio Monitoring Top Sites List that deals with all
areas of radio monitoring. I invite you to check it out and hopefully
list your site.

http://www.topsitelists.com/start/hawkins/

Best regards,

Joe Hawkins

I assume when you started the program for the 1st time you entered
your call sign, followed the instructions and waited for your call
sign to validated.

Usually connections are related to networking.

There is a four page article in the March issue of QST about the
program which i understand is now on the streets in the US.

The guy who wrote the program is some days getting over 100 e-mails,
probably a bit much to try and keep up.

He started a yahoo group ILINK-GEN where you will get lots of help.

Lots of guys in the US are in the group.

Terry ... VK2JTP

I may be incorrect, but I seem to recall that the port numbers are not "registered" but rather are identified as "well-known". Well-known ports are associated with well-known protocols, but that doesn't restrict the use of either the port numbers or the protocols to their associations. We all know, of course, that port numbers below 1000 are considered taboo and can't only be accessed by system processes, but above that, anything goes. It's kind of silly, in fact, that way back in the early daysm, so many port numbers were designated for now-obsolete protocols.

The only problem I can think of with using the same port numbers for multiple protocols would be the listeners would be receiving packets that they wouldn't be able to understand. A properly written daemon should simply discard data it doesn't recognize as it's protocol format.

Hello,the following scopes are available for sale.
.
1----HP1741A   100 MHz dual trace, needs power supply repair.Includes the operators guide,a TEK P6000 probe and pouch on top.Asking $50.00

1----HP1715A   200 MHz dual trace, works good probably needs calibration.Includes manual and TEK P6006,P6012 probes and pouch on top.Asking $100.00

1----HITACHI V422 40 MHz dual trace,works good.Includes TEK P6010 probe.Asking $75.00

1----TEKTRONIX 2445 150 MHz 4 trace,works good.Includes TEK P6138 probe.
Asking $550.00

All are + shipping,lower 48 only.

Regards
Bob Stamper

I like the functionality and user interface, but I often find that it does
not as good a job
of decoding as MixW which is a lot cheaper!

Hello all. I will be moving soon and when I relocate the shack, I plan on having my 2m radio next to the computer and I want to do some packet work. I am probably buying a Yaesu FT-2600, with the dataport on the back of the radio, so I can keep the microphone plugged in to work the local repeaters/simplex frequencies.

Does anyone have an opinion of this radio for 2m packet? Also, what features should I look for in a TNC? I've seen lots of MFJ TNC's for sale. What are the different modes? I am not really sure exactly what I want to do on packet, but I figured it would be fun to use to log onto Packet BBS's and callsign servers at the very least.

Any insight on this topic would be greatly appretiated.

I've erected a MURS packet radio station in the San Diego area on 151.940Mhz. Anyone interested in running AX.25 experiments as a precursor to implentation of initial MURSlink testing - please refer to:

http://groups.yahoo.com/group/murslink/

Hello Tom,

I'm using a Yaesu FT-1500 2 meter mobile for packet. It's a single band radio but it puts out 50 watts and only cost 150$. With a built in data jack it's ready for packet 1200 / 9600 baud. For a TNC I'm using the kantronics kpc3+. It was 150 bucks and works great for regular packet and APRS. I have my setup on my web page at http://my.raex.com/~rramsey click on kc8kpx.

My 2 cents,

Rob Ramsey

Hey that's neat!
Can I use my ham radio callsign on that frequency?
Perhaps 2M has been extended, and I didn't notice?

The world is changing faster every day, old boy - are you EVER going to try
to learn some new tricks?

> Perhaps 2M has been extended, and I didn't notice?

Don't mind Hank - he is LOS-impaired by his hilly/backwoods location... as
such, he has trouble thinking outside of the box. He criticizes any
attempts to use Internet backbones, replace AX.25 with something more
efficient, or to conduct business on MURS.

Only a faint memory for most of us - he pines for the old days of
HF-backboned PBBS networks... when Morse Code defense, and this kind of
silly, non-productive jiving were "in".

Hank is a true "living museum piece".

I don't know the situation in the US, but here the similar "licenses" don't require you to identify at all. When you want, you can use any skipname for your station. Can be your name, your license plate, any word you choose, even W0RLI.

In fact, when I use such a radio here I could use W0RLI as a callsign.
I certainly could use PE1CHL.

Most Dutch stations use callsigns starting with NL, which is a customary abbreviation for Netherlands. They are not aware that in the amateur radio world the NL prefix is allocated to Alaska. And really, they do not need to care.

(this has caused some confusion when people set up (illegal) gateways to the amateur packet system)

And it needs a particular type of sound card which is (AFAIK) no longer
available and was (I think) never very popular.

Well, the FT-2600 I wanted to buy has been sold, but right now AES and HRO are
both selling it for $170 new (it's a special coupon), so I might buy one of
those...

What's "more efficient" about doing the exact same thing
we've been doing since 1983?

> Only a faint memory for most of us - he pines for the old days of
> HF-backboned PBBS networks... when Morse Code defense, and this kind of

How does any of what you post relate to ham radio?

> Hank is a true "living museum piece".

I'm mature enough to know the difference between radio,
ham radio, CB, et al. Are you?

I have a Garmin GPS55AVD aviation handheld GPS that I have had since circa 1992-93 that was hot stuff for us pilots in its day. (no more Loran! Yea!) Anyway, now I would like to hook it up to an alinco dr-135tp and go mobile aprs. I have 3 problems.

1) I dont have the original power/data cable plug (that came with the mounting bracket) because I never used the mounting bracket... instead using a aftermarket yoke mount with a cigaratte lighter power plug.

2) Assuming I can aquire or make up a cable, the gps manual talks of a NMEA "A" , "B" and shield leads... how would these be wired to the mini-plug on the Alinco? (will damage result if trial and error gets them reversed? or is there a standard?)

3) Interfaces listed for the gps are NMEA 0180,0182,0183 version 1.5: dec 1987) with quite a number of approved sentences and transmission rates (time).... however I have no information on baud rate, parity, etc... IE: will this even work?

Any information or ideas would be helpful.

Anything 'could' happen! But I wonder if the original poster wasn't
thinking in post-Sept 11 terms. Given terrorists penchant for using
simple methods and someone else's systems already in place,
could/would they use ARPS to coordinate their plans?

Hi, all.
I just got a KAM+ to use on pactor, but it doesn't connect to distant stations. I can connect fine with a friend across town. I'm wondering if my AGC is too slow or something. I'm using a heath sb-401 transmitter and Drake 2-B receiver. The 2-B is set to fast agc (or course) but still I wonder if it's quick enough to "hear" the ack. I am getting an ack or chirp back from the other station, so I know I'm "hitting" it. Just not hearing it right...

Does anyone have any experience with the older radios. I'd hate to think that I have to buy a new digital radio just for pactor. - if that really is the problem...

Thanks and 73

Actually, our FCC rules do forbid the use of a callsign of another licensed
service and/or the use of a callsign not assigned to one's self.  One needs to
check international treaty to see if this is worldwide.

And rightly so, since within the U.S., such a practice is illegal.

Ironically, they were forced into using callsigns that resemble amateur
radio callsigns by U.S. software that would reject their proposed skipnames
and by a U.S. protocol that was designed with narrow views like "no (U.S.)
callsign is longer than 6 characters"...

Not being considered licensed amateurs, they had no way of allocating
a callsign that is guaranteed not to be used by a licensed amateur.

While MURSlink will work over Amateur frequencies, I've learned to avoid them like the plague... too many complaining blowhards. MURS is a much better radio service for building an Internet-backboned packet radio network... and MURS packet relates to "rec.radio.amateur.digital.misc"... or do you have any better suggestions for a more appropriate Usenet newsgroup? I didn't think so.

After all your years of complaining about the folks who wanted to go to Internet-backboned systems on Amateur VHF/UHF freqs, I would think you would WELCOME the fact that we have moved to a new service(MURS), where business digital communications are clearly allowed.

Hams can't have a practical purpose by law. All other
allocations can.

Yup ... same old non-ham and anti-ham spammers
posting the same old junk to the newsgroup.

So why do you post this non-ham and anti-ham spam to
a ham radio newsgroup? The CB groups drive you out?

So what?

Just more anti-ham spam in a ham radio newsgroup.

Why should we care?

Were they all incapable of writing software, or
changing any of the existing open source BBS programs?

That's not exactly rocket science ..

Even some of the "newer" radios, like the Kenwood TS-930,
needed a mod to speed up AGC recovery. For the Kenwood
it was the removal of a capacitor ... simple to do. Might be able
to do something similar in the Drake.

The crux of the argument.  What good is radio, if you can't
make money off of it, or produce an end-product?

Only a Marxist could fully appreciate Part 97 law.

BBS? Give me a fucking break.

You can write a BBS using MySQL, Roxen, and Pike in about thirty minutes...

To what end?

Radio isn't meant to replace the Internet or telephone BBS. Radio is a method to transport information to a mobile user (walking, riding, or in space). Radio could even be an extension of your wallet.

Which is why the ARRL and it's membership is a dinosaur.

This group is for amateurs, not Amateur Radio alone. Live with it.

The crux of the "argument" is ... spam in this newsgroup.

Consider your bluff called. Post the URL and I'll download and
test it one hour from now. Bet you can't do it given six months.

I am considering buying a Yaesu FT-1500M and had a question. With the ADMS-2F
cable to program it with a computer, can this cable also be used to connect the
radio to a TNC?

They probably were just as interested in writing something as the average licensed radio amateur is.

Timing is more critical when linking with a nearby station (due to small
propagation delay). Most people can easily connect to a DX stn but have
difficulties when trying to connect to a friend across town.
My guess is that you have a signal level problem. Does your RX provide
sufficient audio to drive your KAM+ decoder? Maybe your friend's signal is
S9++ while the distant stations are much weaker.
Another idea would be to turn AGC off completely (not possible on all rigs)
and use RF/AF gain controls.

Funny Funny, or funny sad?

I just checked google archives. Did you know you have
pretty much wasted your life on this newsgroup, and in
all your contributed messages, none of them contained
even a hint of technical information or advice.

It's an endless dribble of messages like those below.

I really feel sorry for you. Such a wasted life. Why don't
you find a hobby you can enjoy?

"Hank Oredson" <horedson@att.net> wrote

Hi Everyone,
I reproduce below an e-mail I have sent to "Timewave" in the US, unfortunately without reply as yet and I do want to get on with ordering the "RIGHT" bits. Can someone help in selecting what I need........

Hi,
I have a PK232MBX with 3 colour LED's ..Serial # 48478 with firmware # 91.08.01. (PK-232MBX without MBX daughterboard)

My question are,
1,...Are ALL the upgrades listed below compatible with my unit?.

#A.. A.06216 PSK upgrade
#B... PK-232MBX/DSP
#C.. PK-232LPK
#D.. PK-232MBX/DSP Operator's Manual - CD

2..Are there any others that are required to bring my "232" up to today's spec'

I will call "Sales" when I receive your reply.

Thank you

Ken Ward (G1ITV)
BOLTON
England
UK.

Ken,
I just tried to send you the response shown below via private email, but your email address bounced. Perhaps that is what happen to our sales dept. email, as well. The entire text of the bounced email follows

From: rgawtry@timewave.com (Randall R. Gawtry.)
To: ken@M3ANDg1itv.fsnet.co.uk
Subject: Re: PK232MBX upgrade_help

Ken,
I'm not sure why you havn't received a reply from sales yet, but we sometimes get overwhelmed by the volume of email. In any event, the answers to your questions are listed below, next to each item.

Thank you,

Randy Gawtry, K0CBH
Timewave Technology Inc.

Yes, $59.95 when purchased with the A.06226 upgrade

> #B... PK-232MBX/DSP
Yes, part number A.06226, $129.00

> #C.. PK-232LPK
yes, part number A.06135, $20.00 when purchased with
another upgrade

> #D.. PK-232MBX/DSP Operator's Manual - CD
Yes, included with the DSP upgrade kit - $00.00

Shipping to the U.K. is about $10-15.

We accept Visa, Master Card, American Express and
Discover cards.

We usually ship within a week of receiving an order.

You may phone, FAX or email your order to us.

telephone - 651-489-5080
FAX 651-480-5066

Ken,

When I e-mailed you the other day the message bounced too. I think it's
the "M3" part of your domain name that's giving trouble.

Hope you get the PK232 sorted.

Cheers,
--
Roger Basford

Who gives a RAT'S ASS about a Usenet charter on a unmoderated group in an evolving world? Only a ninny would think that it carried anything more than the most minor significance. You see, Hank, once again you've shown that you can not adapt to change.

The "spirit" of a newsgroup consists mainly of its name, and what is
posted
to it.

I put it to you again - what better group is there for posting about MURS digital communications? I hardly think that rec.radio.cb is an appropriate forum... I'll tell you what Hank - if you go thru the trouble to create an unmoderated newsgroup called rec.radio.murs.digital, I'll be more than happy to post about MURSlink over there...

The key to this newsgroup is that it is for AMATEUR radio. MURS is not amateur radio.

Additionally, I don't recall you ever coming to an SCDCC meeting during its last 3 years. For whatever reason, you were just as apathetic as the rest of the Southern California amateur community. For some of us, the meeting site was only 10-20 miles from home, but we did have one board member who drove 200 miles for the meetings (from Santa Maria); thus there was no excuse except perhaps for those in Inyo County not to appear.

Yes, quite true, and probably the most important point of all.

However, in the context that Hank is referring to, MURSlink offers quite a few optimizations over AX.25, because it eliminates much of the routing and protocol overhead, and is designed to mainly support the two most utilized/useful applications(e-mail & Position Location) in a slow-speed(<9600bps) packet network environment. With an Internet-backboned cellular-type network, we can eliminate the idea that routing must be done via radio "hops", and that ACKs have to be individually forwarded and targetted, instead of locally broadcast... once these concepts are understood and realized, much of the AX.25 & APRS protocol "baggage" can be tossed aside. My estimates are that a single 1200bps MURSlink-managed channel can theoretically support from 3 to 8x the thruput of corresponding traffic via an old-fashioned combination of AX.25 & APRS over AX.25 channels.

I don't see there being 3 to 8x worth of data to transmit.

I would lean more towards increased frame rate.
That is, APRS is one position an hour for fixed
targets, and as fast as one position every 10 minutes.

What I would propose is a bit rate of 4800 and a
frame rate of a minimum of 10 seconds for APRS, and
200ms for vocoder and raw digital type data.

You need to go to a few Ham Fests. They are practically giving away the old laptops. The last one I was at had a couple of nice working ones, running Windows 3.1, for about $25 to $30. Just modify the autoexec.bat file to stop windows from starting up.

I personally use an old 486 SX25 laptop, with Windows 3.1, and it works fine for all the old DOS software. It's a Sub-Note with a nice little track-ball for the mouse interface and doesn't take up much more room than a mouse pad alone.

I have bigger and better PCs but these old laptops still do the job.

In the example I used, IEEE 802 meetings, there are often several
APs either in the same meeting room, or in adjacent meeting rooms.
As long as the APs are not so close that they overload each other,
front end overload doesn't seem to be a problem as, as I said, the
clients tend to be "self-spacing."

> This changes if you have several APs. This was my point.
> If you suggest to use 802.11b to build a dense wireless network
using
> dishes, PAs etc. you end up with big problems due to overloaded RF
> frontends...

I don't entirely agree ... first I don't recall stressing the use of
PAs ...
as I've mentioned several times, the standard output power of about
+15 dBm will support 11 Mbps for (clear) paths of somewhat over 6
miles,
assuming a 20" dish at each end. If you'll settle for one of the lower
data
rates, you can either reduce the antenna requirement or get longer
range with the same antenna ...

If the network is "dense" then you don't need long point to point
links, high gain antennas, etc.

All in all, from practical experience, I don't see front end overload
as
a major, limiting factor.

Carl - wa6vse

rec.radio.amateur.digital.misc:4285

Greetings de N6XQY. I am trying to set up a Tiny-2 with GPS support to operate with my Magellan GPS-315 GPS and Kenwood TM-V7A dual band mobile. I have already made the cable for the DATA port on the V7A for the TNC's DIN jack, and have the Magellan serial/power cable for connection to my TNC's serial port. I have not been able to find a text specific to the Pac-Comm Tiny-2 that lists the settings in my Tiny-2 that I need to get up and running in the mobile for position reporting on APRS. Linda at Pac-Comm shipped me the current firmware manual with the required GPS-enabled eEprom, and I am able to communicate with the TNC from my PC, so all I need are the settings to get up and running. If anyone out there can help here, it would be greatly appreciated. It seems that the command set for this TNC is a bit different from say, a KPC-3, and that's the only info I've come across here on the Web.

Thanks in advance,

Doug Gavilanes, N6XQY
Garden Grove, CA.

With all but the newer computers all you got to do to run DOS is boot the thing with a DOS disk! Evidently Microshaft (or somebody) decided that wasn't something they wanted to continue to allow, and I notice the newer units I've had my hands on won't do that. All the WIN95 machines I've seen will. A year and a half ago I bought a Compaq 466 mhz tower that I could never get to boot on a DOS disk. It runs Windoze ME.

Also you might be able to use the "Windows setup disk" floppy that not only boots DOS but also installs the CD drivers....

Dick

Did you check the boot order settings in BIOS. Apparently the default
setting for that machine is first C: then A:, but changing this to
first A: then C: allows booting to anything you like.

Never mind. I've resolved the settings issue. Now that I've hooked it all together, the DCD LED won't turn off regardless of whether there is a packet coming through or not. Therefore, the TNC is not sending at all. I have confirmed my connections several times: TNC DIN 1 to 6-pin Kenwood pin 1 (TX data from TNC), TNC DIN 4 to 6-pin Kenwood pin 4 (for 9600 baud data out to TNC), TNC DIN pin 2 to 6-pin Kenwood pin 2 (GND), and TNC DIN pin 3 to 6-pin Kenwood pin 3 (PTT). If I key an HT nearby, that interrupts the DCD LED, and the TNC keys the mobile. Real strange.

Oh, well.

OK, got it straight. Tried to wire up the rig for 9600 baud. Bad idea. I disconnected the 9600 data out from the radio, connected the 1200 baud data out, set the TNC jumper for 1200 baud, and away we go. Some of the cabling diagrams here on the web are in error, showing the 9600 line used, or showing the 9600 and 1200 lines jumped and connected to the TNC. Fine way to spend a Saturday. Anyway, I hope that this helps anyone with the same dilemma.

Greeting Fellow Warblers.. MixW Software is proud to announce that version 2.03 has now been released and also a brand new Help File Written by Scott Thile has also been posted on our Website which is: www.nvbb.net/~jaffejim/mixwpage.htm   Most of you already know that MixW which is the Shareware version of our DigiPan Freeware does every single one of the digital modes plus two fancy high speed logging systems one for normal and one for contesting. the modes include RTTY, CW SSTV BPSK QPSK FSK31 Throb MT63 MFSK Hellschreiber VHF&HF packet TX and RX plus RX on both Pactor ARQ and FEC plus FEC TX/RX on Amtor RX Amtor ARQ (isn't that enough???) You can download a full working copy off the site. The only restriction on the software is a 15 day timer...Registration can be had for $50.00 and a special file will be sent to you which will both stop the timer and register the software....for full details see information on the website. Best 73 and Happy Warbling.. Jim, WA2VOS
Below are listed the complete list of updates and fixes to the program:
MixW version 2.0 Changes and Updates

MixW version 2 Release Candidate 2

SSTV mode
SSTV is accessible from menus
History tab is added
CAT changes
IC 756 PRO has been added to the list
FT 847 PTT bug fixed
ICOM PTT via CAT COMMAND implemented
MACROS <CATCMD:asciicmd> and <CATCMDHEX:hex bytes> are added. Example of usage:
<CATCMD:FE FE 56 E0 1C 00 01 FD>. This let you send any CAT command to the TRCVR.

Log bar
Lookup call button (Alt+K) has been added
New macros
<SELCALL>, <SELNAME>, <SELQTH>, <SELRSTR>, <SELRSTS>, <SELNRR>, <SELNRS> mean the same as <CALL>, <NAME> etc but for selected line in the log bar.
<CATCMD:asciicmd> and <CATCMDHEX:hex bytes> (see CAT changes)

MixW version 2 Release Candidate 3

-(!) INI files are no longer stored in WINDOWS folder.
  Move all MixW*.ini and all .mc files to MixW folder.

- SSTV
  - Crash bug has been found and fixed.
  - Right click on history bitmap shows it full-sized (only if it was auto-saved)
  - R36 and R72 modes added
  - Settings dialog is modified. AutoSave and Open Picture do not work, will add them tomorrow before annoucing RC3.
  - Video ID
    - This is a new feature to transmit Video ID visible on the waterfall Since the power is divided by all points transmitted at the same time, do not make long horizontal lines.
    - Two VID samples re added : butterfly.bmp and mixw.bmp
- MACROS for SSTV:
  - <FONTFACE:nnnn> example: <FONTFACE:Arial>
  - <FONTCOLOR:n> example: <FONTCOLOR:9>
  - <FONTBOLD:n>   example: <FONTBOLD:1>
  - <FONTITALIC:n> example: <FONTITALIC:0>
  - <FONTSIZE:nn> example: <FONTSIZE:26>

- CAT
  - added Comport conflict extended diagostics
  - FT817 support
  - the number of ICOM models is extended to 33
  - possible custom CI-V address for ICOMs

- Search dialog (glasses)
  - global optimization.

MixW version 2 Release Candidate 4

- MT63 mode

Sideband inversion is not supported for MT63 yet, QRX for RC5.

MixW version 2 Release Candidate5

- new DxCluster dialog
- SSTV ZOOM window
- New macros added:

<MODE> prints current mode

<KHZ:n> Frequency in kHz with n digits after decimal point
<KHZ> the same as above with n = 0
<MHZ:n> Frequency in MHz with n digits after decimal point
<MHZ> the same as above with n = 1

- Some bugs fixed
- Expiration date is set to June 30.

MixW version 2 Release Candidate 6

- RTTY 850 Hz shift must work now
- MT63 now allows not only 500 Hz start frequency
- DXCluster wrong mode selection bug is fixed
- ... and some more less important bugs are fixed including one registration-related.

MixW version 2 Release Candidate 7

Added:

- Added CWR and FSKR transceiver modes to drop-down mode menu.
- Added <SPZOOM:n> (n=0.5,1,2,3 or 4) to set spectrum/waterfall zoom.
- Spectrum/waterfall shift position is now saved (and restored :-).
- Added <INV>, <INVON> and <INVOFF> macros to quickly change inversion.
- 8-bit encoding in MT63 mode is added (see MT63 settings dialog),
- Contest Settings: added Check Dupes regardless of Band or Mode check-boxes.
- <LASTCALL> macro (not in list), unlike <GRABCALL> captures last call appeared on the RX screen.
- CW weight correction (in 1ms intervals) to compensate CAT CW delay. (+1 to add 1ms delay, -1 to subtract 1ms, and so on.) See CW settings dialog.

Bugs fixed:

- Auto Search Log name and QTH bug is fixed.
- AFC in MFSK in full duplex mode stopped.
- <ALIGN:nnn> on LSB bug is fixed.
- Several contest bugs are fixed, but contest mode is to be re-written.

MixW version 2 Release Candidate 8

- New soundcard module with much better RX stability in heavy multitasking environment.
- Manual RX is supported for SSB and CW with usual highlighting, call grabbing etc. (For CW: goto Mode settings/Rx Algorithm/Manual)
- Multiple call registration is available
- Mode specific info is displayed in the status bar.
- some minor bugs were fixed
- expiration date for non-registered users is set to July 14.

MixW version 2 Release Candidate 9

- CW Old MixW 1.45 alg added
- SSTV Picture Preview in load picture dialog
- SSTV Tx load history tab
- TUNE transmitter menu item
- NEW MACROS

<WPM:nn> <WPM+nn> <WPM-nn> - for CW, absolute and relative speed change
<WPM:RX> Make TX speed equal to RX
<LOADPICTURE:filename> - if folder(directory) is on the place of filename, RANDOM picture from that folder will be loaded.
<TUNE> - start tuning tone
<STOP> and <ESCAPE> - equivalence of keyboard Escape

- TEN-TEC PEGASUS support via external file (external PEGASUS control software is required.

In PTT&CAT dialog, select CAT=TEN-TEC, Model=Pegasus/Jupiter, Software path = directory of Pegasus software, like D:\PEGASUS .
In PTT&CAT Details sub-dialog, choose a port number for PTT control and DTR/RTS behaviour (baudrate etc. does not matter).
Run the software (BBTRX1.EXE).
Then MixW will read and write transceiver frequency and mode.
* RTTY via transceiver FSK port:
Go to Configure > Secondary PTT/RTTY port menu.
Check "Use this port for RTTY output".
In Port Settings sub-menu, set up port number and RTS/DTR pins (other settings do not matter).
In PTT&CAT dialog (from Configure > TRCVR CAT/PTT menu), enter FSK center frequency (according to your transceiver type and settings).
In bands.ini file from MixW directory, add lines for each band you want to use with hardware RTTY, like
20m RTTY FSK 14065 14112 14080
where 20m = band name, RTTY = real mode, FSK [or FSKR] = transceiver mode used to operate RTTY,
14066, 14112, and 14080 = start, end, and preferred frequencies. (With such lines, MixW will switch rig to FSK [or FSKR] mode for RTTY by default.) Then restart MixW to let it re-read bands.ini. RTTY output will be sent to this COM port and to the soundcard in parallel.

MixW version 2 Release Candidate 10

Tip of the Day window is added. Please suggest new tips!
(You may also edit tips.txt file from MixW directory.)
See ExtProg.html to learn about interfacing MixW with other programs (short VB samples are included):

- Printing QSL cards;
- Passing QSO data to external loggers;
- Passing data to external maps;
- Switching/rotating antennas;
- Custom callbooks.

Contesting for Monkeys article tells about an example of using MixW in contests. See MonkeyOp.html.
New fields are added to the log file:

- Domain (state, etc.),

- IOTA,
- county,
- QSL manager.

Callbook fields can be viewed via DDE when Callbook dialog is open.
See MixW DDE test.doc file from MixW directory for details.
Two user-configured Log bar layouts are added.
See Configure > Log bar > Custom 1 & 2 menus. Resize Log bar columns by their gray headers. Double-click on the border of a header to restore it's original size.
Contest mode: separate menu (View > Contest mode > Activate contest mode) is added to turn on/off contest mode.

- Domains, states, etc. (see Contest settings dialog) are now grabbed to Domain field or Serial NR (see "as Domain" and "as Number" switches);
- Contest time is now grabbed to Exchange Received field and added to the exchange number, like '001 1532' (001 is a number, 1532 is grabbed time). In Search Results dialog, click Callbook button to open the Callbook dialog for a selected callsign.

Export to Cabrillo format file:
2 formats are now supported:

- rst + number,
- [number] + name + domain (NAQP contest etc.).

Export to text files:
New log fields are also added to export list. Using a text editor, exported TXT file can be converted and sent as a contest log.
Icom transceivers:
CWR, FSK and FSKR support added;
Configurable output amplitude for each mode. See Mode > Output amplitude for this mode menu.

MixW version 2 Release Candidate 11

Expiration date (for unregistered users) is October 1, 2001.
Fixed bug with FSK RTTY transmittion (COM port bug under Win98).
Added Snap for 22 Hz RTTY.
Added "Clear QSO data?" question when clearing QSO (hold Control key to bypass this message).
Scottie DX TX Bug mode FIXED
See StarOffice MixW DDE test.sdw file to see how to use DDE interface with Star Office.

MixW version 2 Release Candidate 12

Fixed RC11 lockup-related bug.
ROTOR support is extended with four buttons on the world map (visible only when any rotor is selected).
Macros added: <ROTOR:SP>, <ROTOR:LP>, <ROTOR:nnn>.
<OUTPUTVOLUME>,<INPUTVOLUME> macros added to call Windows Volume Control.
Some minor bugs are fixed.

MixW version 2.0 Regular Release

Added support for changing territorial characteristic and country for a call or group of calls, also giving them an area name.

In Edit QSO dialog (when editing a QSO details), click Change button. Enter a call or mask (wildcards '*' and '?' are allowed).
Give a name for this call area. Choose an existing country to add this area to. Fill other required fields.
These changes are stored in pfx.dat file in MixW directory.
Added restoration of an accidentally deleted QSO.
Click File - Restore removed QSO menu.
Added WW Locator, IOTA number, domain (state) and county settings.
See Configure - Personal data menu.
List of contests dialog has been moved to View - Contest mode menu.
Double-click sets the selected line active. To deactivate a contest, choose "No contest".
Added CQ zone, ITU zone, Domain or DXCC prefix auto suggestion. See the Contest Settings dialog.
Log Statistics dialog has been moved to View - Statistics - Brief log statistics menu.
Added statistics filters for displaying contest statistics on-the-fly.
In Contest Settings dialog, click the Statistics: [...] button and choose a statistics filter. Then, click View - Statistics -
Show contest statistics menu to display the statistics window.
Contest filters are actually DLL files that are located in Plugins subdirectory in MixW directory. See the bottom of main MixW page for the list of available statistics DLLs.
To automatically generate Cabrillo contesting log for a given contest,
Run Search in Logfile dialog (File - Search in logfile menu). Uncheck all check-boxes except Contest. Choose a contest from the list. Click Display button. In the search results dialog, select the lines you want to export (right mouse click for additional options), then press To Cabrillo button.
After viewing the contest statistics, fill the required fields and press OK.
Added Quick Search dialog for searching for incomplete callsigns.
In View - Quick search menu, choose your preferred method of searching, then click Show dialog to display the Quick search dialog.
Enter a part of a call into the the new QSO cell of the Log Bar. Wildcards ('*' and '?') are allowed.
Red ticks indicate if we already had a QSO (dupe) with this station (according to the current contest settings).
Changed the order of columns in DXCluster dialog.
Trial period date (for unregistered users) is 15 days after installing the program.

MixW 201

MixW 2.01:
- New macro:
<INIFILE:file,section,name> - insert a line from an ini-file.
Suppose I have a program that measures the temperature using a sensor outside of the house and periodically writes the value into

d:\temp\sensor.ini file:

```
--- start of d:\temp\sensor.ini ---
[Sensor]
Temperature=xx
Humidity=yy
Illumination=zz
--- end of d:\temp\sensor.ini ---
```

Then I can make a macro:

```
The current temperature in Kiev is
<INIFILE:d:\temp\sensor.ini,Sensor,Temperature> degrees centigrade.
```

- Export to CSV format

See the Search Results dialog.

- Export to text format

Text format has been changed.

- PTT & CAT dialog

"DIG" drop-down box sets DIG mode (for YAESUs only) to use LSB, USB, or FM.

- Search dialog

Added "QSL sent" and "QSL received" search options.
Print support is added.

- CW

Proper receiving of own CW while keying with Joystick or Mouse.

- Install

Icons are created on the desktop and Start Menu.

- Bugs

SSTV dialog remembers the last position

MixW 202

IARU beacons dialog added (menu View > NCDXF/IARU Beacons)
Be sure your computer time is set correctly, high accuracy (+-1 second) is desired. Use wellknown freeware utilities like NetDate to be in sync with the whole world automatically.tcp/iiip
GPS or any other precise clock source may be used as well.
Click onto desired frequency to move the TRCVR there.
Previous Fq and mode will be restored after closing the dialog.

TCP/IP connection via PACKET, as an alternative to SV2AGW PACKET ENGINE and FLEXNET. Requires additional network driver
(For additional information click here)

MixW 203

Mouse wheel support (tunes the transceiver)
(see PTT&CAT settings dialog)

Hellscreiber:
FM mode is added (see mode settings)

SSTV:

CWID is supported now

Icom IC910H, IC718 and Yaesu FT1000M transceivers are added to the CAT list

Scanner dialog (see View - Scanner menu)
Very useful for looking for DX on "dead" bands (10m, 6m, VHF, UHF)

New macros:
- <ALERT:text> - Brings up message box with "text"
- <BEEP:xx>, xx = On or Off. Switches the beeper
- <OnEnterNNN>, <OnLeaveNNN>, NNN = 160m, 80m etc. Macro to
execute nn band change. Define such macros of you need to do
extra work on band change (like run external program to switch relays or
send specipic CAT command to the TRCVR)

Friendly "No Soundcard" message

Manual entry mode now sorts log entries
(see View - Log bar - Manual entry mode menu)

Log scanning procedure improved (takes less time)

VHF 2400/4800 packet is reanimated

Some Brazilian prefixes added

From Configure menu, select "Default macros" or "Macros for this mode", then
click "Edit" to see the list.
Use "Merge from" button to ADD macros to the list. This feature is useful to
add transceiver-specific macros.
For example, CatKenwoodTS450.mc may contain several macros:

Name: AIPON
Label: AIP on
Text: <CATCMD:MX1;>

Name: AIPOFF
Label: AIP off
Text: <CATCMD:MX0;>
and so on.
Then you can use <AIPON> and <AIPOFF> to control the transceiver like if
they were built-in macros

PACKET settings dialog:
- General tab:
- Separate callsign box for TCP/IP operation
- Parameters tab:
- 9600 baud (G3RUH-compatible) bit shapes (select one of 16)
- Beacon/monitor tab:
- Show content of IP/ARP packets
- Baudrate measurement (show baudrate of "I" packets)

Be sure your computer time is set correctly, high accuracy

(+-1 second) is desired. Use wellknown freeware utilities
like NetDate to be in sync with the whole world automatically.
GPS or any other precise clock source may be used as well.
Click onto desired frequency to move the TRCVR there.
Previous Fq and mode will be restored after closing the dialog.

The TRCVR/CAT dialog has an option "Show zero beat frequency"
Export: DxccPfx is added
Statistics: SSTV is no longer DIGITAL
Word mode added (menu View). To turn on or off this mode use new macros
<WORDMODE:ON> or <WORDMODE:OFF>
Capitals Only mode added. Use according macros <CAPITALSONLY:ON> or
<CAPITALSONLY:OFF> to switch the mode.
<MEMW:n> and <MEMR:n> macros are equivalent to Ctrl+n and Alt+n
and can be used to save and restore current frequency and mode.
Some fixes for YAESU CAT control
Elecraft K2 Support added (see Kenwood settings)
Callbook datapath adviser (for those who do not want to read FAQ :-)
CWID amplitude bug fixed (now it follows current mode setting)
SSTV:
- WWV mode can be used to calibrate the soundcard while receiving WWV
signals. Time marks are transmitted on 4996, 9996, 14996 KHz.
Tune TRCVR to 4994.100, 9994.100, 14994.100 (USB) accordingly since
Be patient if you do not hear anything. Time marks aren't transmitted
all the time, up to 5 min. pauses are expected.
- SSTV slant correction can be moved to soundcard samplerate
correction, to let other modes use that correction as well.
See button "Go" in SSTV mode settings dialog.
- Zoom window now is non-modal, so it can be placed anywhere to see
what's being received while preparing the TX picture.
- Up to 16 history bitmaps can be shown now (smaller size, of course)

The 100:1 sounds like the audio signal will be too weak, especially the 1-2mv signal sounds way to low for audio input to rig. Try removing the fixed attenuator and place a variable resistor in it's place. Then transmit and use it to set the mic audio level for best results.

You really should use an isolation transformer on the mic audio at least. I use a Radio Shack 1:1. Really should have one on both audio lines.

When jammers also have APRS running, the FCC computer will tie into the NSA
computer and a Brilliant Pebbles satellite will use a laser to take the
jammer off the air... permanently.

It could happen!   :-)

I don't know that I'd agree with that. :)

Hi,

Can anyone tell me if the CD-ROM version of the PK232MBX manual supports
the ver. 7.1 EPROMs? I've asked Timewave but have had no reply.

Also, anyone using the PSK mod kit for the 232? Is it a good buy?

Regards,

Hello all.

When inputting thge height data for your APRS station, should you use sea level...or ground?

Thanks.

Hi,
Looking at several laptops I find that their AC adapters all output 19VDC but the internal (infernal?) batteries are less than 12V. Is anybody running their laptop directly off the (nominal) 13.8VDC from their car? If so, do you just plug it into the DC input or ???.
TIA

Yes, The CD copy of the manual has all the attachments.
>
>Also, anyone using the PSK mod kit for the 232? Is it a good buy?

If you already have a PK-232 it is the only solution which allows you
to ran PACTOR under windows as well as the the soundcard modes without
having to change cables or reload the operationg system.

If you dont have a PK-232 and dont plan on running PACTOR the Rig
Blaster is a good choice (I have one).

Automotive electrical systems can have some pretty hefty spikes on them at times (sometimes as high as 60 volts). I wouldn't connect my laptop directly to it without some type of protection. Targus has an "auto/air" adapter out for about $100 that has a programmable output and is supplied with a variety of adapters. You pick the adapter from a list for your make/model computer. The input fits a cigarette lighter or an airliner connector. The one I have doesn't appear to generate any detectable RFI.

Mine run 15 to 20VDC. The easiest solution is to get a 150W AC-DC inverter for the cigarette lighter jack, plug in the PC's power cube, and not worry about reinventing the wheel. I do this on occasion to reprogram my TNC in the Jeep, and it saves me many headaches.

I use a 300 Watt Inverter, and run several AC appliances in my panel truck, as well as the laptop. I actually have conduit and a metal receptacle box, that runs all the way to the battery. The inverter is on the firewall for cooling. Great way to go.

The other thing I found, was a bunch of 12 Volt adapters from IBM. These plug into the cigarette lighter, and have a black box that filters and regulates the DC. I got them at a swap meet for $3 apiece.

Does anyone have any technical details on the I-Link protocol? I've visited http://www.aacnet.net/, of course, but am finding virtually nothing of use. The QST article in this month's issue was essentially a better version of the users guide, but didn't have any details either. Unlike PSK31 where Peter Martinez and others have done an excellent job of making the details available, I-Link seems to be a mystery. I commend Graeme Barnes on the I-Link program, but as a ham, I'm not about to try it if I can't unscrew the panels and inspect the guts first.

Thanks for any pointers and 73 to all,
-- Dave, WA0TTN

I've seen car adapters for laptops at CompUSA. I don't know if they're universal or model-specific. I would guess they do the voltage conversion necessary and also have noise/spike suppression built in.

>TIA
>KA3DWW

I have done just exactly that with an older Gateway that had a power supply rated at 17 volts or so. The computer would run, but it was always giving me the low battery warning, and it would not charge up the battery. But it did run reliably as long as the car was running and the car's buss was being charged up to the nominal 14.5 volts. When i would shut down the car, it would usually hold up for a few minutes and then slowly sink down and error out into sleep mode for 'dead battery' failure.

All I did was fabricate a 12 volt adapter from the car's lighter outlet to the laptop's external power input. As other's have noted, the 12 volt system on a car is subject to some nasty starting spikes, so I took the precaution of not having the computer connected to the car during startup.

I don't know how it will work for computers rated for 19 vdc input, I haven't gotten around to trying that experiment yet as I put an inverter into the car for other purposes and it was just simpler to plug the current laptop into that. But it does make for a rat's nest of wires on the seats or floors. But then, my car is stuffed with ham gear anyway, so nobody really notices a few extra wires.

Hope that helps

No, Clint Black is correct, I'm just looking for technical info. For example, what's the network model look like, what TCP port(s) does it use, what's the data protocol, is it based on any standards such as G.723 audio, etc. I'm not interested in the source per se, but would be interested in writing my own implmentation.

If nothing else, I'd like to know if the I-Link details are considered proprietary. If so, then I have no interest in using it. If it's not proprietary, I'd like to have a choice of freeware applications as there is in the PSK31 world. Or possibly write an ActiveX control as I've done for PSK31 (http://www.netdave.com/wa0ttn/PSK31.asp) that would enable others to write I-Link applications of their own.

I think the only man who can answer all your questions is Graeme,
M)CSH who wrote the program. His e-mail is on his web site aacnet.net.

I do know that it uses UDP Ports 5198 & 5199 and TCP Port 5200.
He also modified the CODEC file to better handle Dial Up in the UK.

I have been involved with iLINK since it started and know that Graeme
has not published any details like those you are looking for.

I downloaded iLink and tried to use it. It loaded ok, saw the begin window, when I highlighted and pressed go to connect, I was not able to get audio across. In a smaller window, the prompt constantly showed receive, but standby always flashed in red, and decoding entry was seen. I looked under help and all the various buttons but was not able to remedy the problem. I also emailed for help 3 days ago, no response. The program looks great to use, I wish it would and if the author,programmer is reading this please email back with help and I'd love to re-install again. I believe the help and solution area are a bit weak but overall I'm real disappointed that I could not get it to xmit or receive on repeater.

Thanks Terry. I just fired off a message to Graeme. In the meantime, I came
across IRLP which may be of some help in understanding the evolution of
I-Link. I appreciate your comments, 73.

I had some difficulties getting it working and traced it down to (probably) my cable ISP service not routing some of the necessary packets. When I tried it on my dialup ISP, it worked great. I think tunneling is going to be an issue using UDP or arbitrary TCP ports. He's got support for ICS, but that's only if you've got control of your firewal, not if your ISP is filtering packets. I hope to get more enlightenment on the future of I-Link from Graeme.

The new version 2.7 of Skysweeper seems to be released (www.skysweep.com)
Now it seems to have also SSTV and HELL transmitters.

Why are so many programmers using unregistered ports, or ports registered to someone else?

(otoh I would not know why an ISP would be filtering these ports....)

     You should be able to obtain one by paying for your copy, just like
those of us who feel that SkySweeper's author deserves compensation for
the enormous amount of work that was put into the program.

Yeah I didnt know that either! When did somebody come up
with a way to do PACTOR with a sound card huh???

Yes, you can run PACTOR ARQ with a sound card BUT NOT UNDER WINDOWS!

It is WINDOWS that is the problem. RITTY version 2.xx by K6STI will operate RTTY and PACTOR (RX and TX) using a sound card. But RITTY only operates under DOS! Unfortunately, RITTY is NOT free. You must buy it!

But Note the newer versions of RITTY only support RTTY not PACTOR. But I understand that you can still buy licences for version 2.xx from K6STI

If you really want to operate PACTOR without spending very much $$$, pick up an old RTTY terminal Unit like the AEA CP-1 for $10 off EBAY and run the FREE TERMAN93 program under DOS. TERMAN93 will let you operate RTTY, AMTOR and PACTOR under DOS using a simple TU.

(Another choice is to use the BMK-MULTY software by G4BMK which is apparently a little better than TERMAN93 but costs$$).

This is not what I said. I don't mean 3 WLAN adapters connected to 1 access point but 3 WLAN adapters trying to access 3 access points on different "frequencies" with antennas only some centimeters apart. This does not work as the RF parts of the WLAN adapters cannot handle this (I guess they are using the old Intersil PRISM chipset, but I'm not too sure about that).

Someday we'll be able to route our radio voices over ip and
select the repeaters we wish to get into. Until then, its
a sporadic novelty like DX due to ducting (fun but nothing
you can use frequently or with specific intentions).

That could be a great assistance in homeland security
issues. But there needs to be good research, design, and
implementation at a funded group (ARRL + TAPR + Radio
Manufacturers consortium) that facilitates it. It would
be the "radio router/modem" project. Its not if, just when and

who.

If you happen to sit on the design committee, PLEASE make
sure the BW is high enough for video frames too.

John

Using DTMF pad on your HT you can connect to a many repeaters around
the world.

For details of the interface boards available to do this see ...

www.ilinkboards.com and www.ilinkca.com

You would need a pretty good HT to handle the BW.

Hello

If you have the manual it tells its capabilities.

Whatg do you mean by it needs restoring? If you need to have it repaired contact

Digital Electronic Systems Inc
565 Paul Morris Drive
Englewood, FL
34223

des@ewol.com

They manufactured it and labled it for Universal Radio.

Mine failed once, the cpu died, DES was helpful in troublshooting and sending a replacement cpu at reasonable cost.

Ted

Other brave bad games will reject weekly alongside tags. We look them, then we absolutely believe Oliver and Patrice's thin orange. All think barbers shout Gilbert, and they weakly fill Ophelia too. Are you abysmal, I mean, climbing beside quiet counters? Try moulding the river's ugly pool and Alfred will laugh you! While balls finitely attack bandages, the papers often call on the urban trees. We measure weak smogs under the wide cold bathroom, whilst Edward slowly talks them too. My healthy sticker won't hate before I recommend it. It explained, you received, yet Wally never virtually cooked about the spring. Her yogi was heavy, rude, and pours before the window. Fucking don't play a dog! I surprisingly converse active and tastes our pathetic, new diets above a doorway. When doesn't Darcy scold subtly? Lots of rural dark teacher expects cars over Brian's bitter grocer. Will you depart through the fog, if Russell halfheartedly solves the painter? You won't wander me dining beside your sticky navel. Don't even try to burn the candles deeply, fear them smartly.

Ted,

Thanks for the above info, I was interested (amongst other things) to know if the firmware had been updated since the 7000's introduction. I had searched for Universal but got the radio store!

Regarding "restoring", perhaps repair would be a better word! My 7000 was sold at a ham rally as a non-worker, I knew that it was a good quality unit and so decided to take it on. It looks as though there hasn't been too much damage inflicted by the previous owners but I do need to check some IC types and locations as they don't agree with what's shown in the book. I'll try asking Digital Electronic Systems for their advice and then see how I go from there.

Thanks again,

Roger (G3VKM)

Well, yes, if you place the APs so close together that they all suffer front-end overload from each other, you'll get poor performance ... spread them out a bit and it should work just fine.

Also, if you only had 3 client devices, why not run them all on the same AP???

Cool!

I tried it using 146.52 (standard simplex calling freq).
Nothing happened.
Why is that?

Recently I've had a bunch of discussions with Red Cross
folks in charge of emergency communications. They knew

about these projects. Their comments ran along the lines
of "Well, if the phone are working, we don't NEED ham
radio, because the phones work thus the internet works.
We need ham radio when the phones are not working
or when we cannot access the internet because our ISP
is shut down due to the emergency."

They need voice for tactical information, but want to use
email for strategic information (situation reports, supply
orders, personel assignements, H&W, etc.) What they
described was basically "The internet, but using only ham
radio for connectiviy, since there may be no other connectivity
available." Once the traffic is out of the disaster area, it
can be handled by any means of course.

Seems like what hams are doing is the exact opposite:
designing systems that will fail whenever phone lines
and/or internet connectivity is not available.

I suggested they might want to look into DirecPC and other
two way satellite internet links as one possible solution.

Hams certainly seem unable to supply what they need.

there are several versions which were updates adding modes, the Universal Radio web site might have a chart showing the differences in versions, as for the locations not agreeing with the manual I cannot help as I don't know. The one I own is version 7 and the ic chart was correct in my manual.

The same should be done with the client devices of course!  And that is
something not so obvious to the users.

>Also, if you only had 3 client devices, why not run them all on

This is probably a matter of policy.

Same story we've been hearing: Ham voice to back up the phones; packet
to backup stratigic comms. It follows that improved packet is desireable
if it is as available as existing packet.

>Ted
>
Ok Ted,

Many thanks again. My 7000 and manual are ver. 7 too but, as far as I
can see, the table of ICs used (Appendix 8, page 88) doesn't match the
layout diagram.

On my page 88 there is no IC57 but there is one shown on the layout next
to the back-up battery and this is one of the missing devices. It isn't
too critical as it's the pre-amplifier for the two RX inputs, so a
substitute shouldn't be difficult to find.
```

The other device missing is IC54 which provides RESET to the processor. The type number on page 88 is PCD8582, which a Web search turns up as a PIC, so more difficult to source along with it's programming (if it is in fact a PIC - which I doubt). There's also ICs 55 & 56, shown on page 88 but I can't see 'em anywhere! If you've a different layout and IC list I'd appreciate a copy or I could scan mine for a comparison.

I've sent an e-mail to DES and await their reply.

Regards,
--

Unless all the ISPs in the country are shut down by the government, there are going to be working ISPs outside the disaster area, so it is also important to be able to connect the networking the disaster area to the rest of the world.

>They need voice for tactical information, but want to use
>email for strategic information (situation reports, supply
>orders, personel assignements, H&W, etc.)

I assume that H&W refers to messages generated by people in the disaster area to their relatives outside the disaster area, telling that they are OK. How would this traffic be handled, by reading from one screen and typing in on the other system :-) or by reconfiguring the VPN to allow such traffic from and to the packet network ?

For effective emergency communications, you need connectivity to the outside world as well as connectivity within the disaster area. In the area, the system must be truly portable, so that it can be quickly set up where needed, even if no roads are available.

How many of the current packet systems are independent of the mains power and can be manually moved any longer distances ?

Paul

I am looking for some help in getting started with PSK31 please.

I have a Yaesu FT77 with 4 pin mic connector (Grd, PTT and Audio)
I have a laptop computer (with audio out and microphone in) both 3.5mm sockets.

The laptop does not have a LINE-IN or LINE-OUT, but the audio out and microphone in sockets such suffice ?

I have DIGIPAN 1.6 software.

I have �built' the simple interface as shown in the Digipan help file as follows:

FT77 headphone to Laptop Microphone In.
FT77 Mic Audio and Ground to Laptop Audio Out using a 100:1 attenuator (2 x resistors).
FT77 Mic PTT and Ground to Laptop COM port (using a simple switching circuit of 2N2222 / diode etc).

So far:

1. On receive - no problems.
2. On Tx ��.. there doesn't seem to be enough voltage from the Audio out of the laptop. Measurement of audio (with all computer soundcard mixer controls on FULL) is only 1 or 2 mV max. (According to Digipan help file this should be 1V when not attenuated and approx 10mv when attenuated ?)
3. So � laptop does not seem to be getting sufficient audio to the FT77 microphone to modulate the PSK31 signal (whether through the attenuator or otherwise !).
4. That seems odd because the audio through the laptop audio out socket seems very loud when connected to a pair of headphone !
5. I have tried adjusting the FT77 MIC GAIN.
6. Or perhaps I am on the �wrong track' ?!

Does anyone have any ideas ? I don't really want to start building an interface with OPTO Isolators and transformers unless sit is absolutely necessary.

Please either answer here or Email to: Hugh_Beverley@hotmail.com

Thank you !

Currently, messages can passed via VHF packet nodes into the ARRL traffic system. I can connect to one of several nodes in my county from a portable packet station, thence to a node 50-100 miles away, etc. to the other coast if need be. The final "hop" to the non-ham recipient is often by voice land line, or by email if available. AFAIK, the latter would require reformatting/typing the message from the ARRL traffic format into a form readable non-hams. I'm new at this but ARRL does stand for "ARRL" and have been doing this for a day or two :o)

> For effective emergency communications, you need connectivity to the outside world as well as connectivity within the disaster area. In the area, the system must be truly portable, so that it can be quickly set up where needed, even if no roads are available.
>
> How many of the current packet systems are independent of the mains power and can be manually moved any longer distances?

I suspect the answer is "Most of them." My node can automatically foreward packets to nodes in the state capital 50 miles away and is powered 24/7 by "floated" batteries. I can reach it from any 2 of the candidate shelters proposed by out county emergency folks using my 2 TNCs, laptops and HT's - all DC powered. Max operating time sans recharge is determined by the laptop (several hours), but we have gasoline motor/generators for that. Mine provides 5KW and has a 50 gallon fuel tank. My fearless leader, our county ARES EC, also has a battery-powered node at home and at least three other hams in our very rural county have portable systems that can access them. The same is basically true of the surrounding counties except they are richer and have more gear & people.

We do *not* expect packet to *replace* voice; rather the two compliment each other. Our plan is to put packet stations at designated shelters to provide H&W and logistics comms and voice radios in vehicles, et al, for "tactical" comms.

I did a quick "isolated" hookup simply pluging a mic into the PC and laying it on the radio speaker and vice versa. It seemed to work altho I was unable to make any contacts b4 the XYL ran me off *her* radio :o)

To solve a similar problem with my radio, I used a Radio shack miniature audio transformer 8 ohms to 1 k ohms. Hooked 8 ohm side to pc and 1k ohm side to radio. Then I turned down the output of the sound card. Many sound cards are distorted at high levels.

Hello all;

I just bought a used PK232, and I am looking for the best software to use
with the unit. Any suggestions? Any freeware or shareware?

Thanks.

I am studying for the GRO license, and the questions on necessary
bandwidth are puzzling, e.g. Q.7.70, "what is the necessary bandwidth
of a 170 Hz shift, 45 Baud emission J2B transmission?" The answer is
249Hz which seems to be calculated from 170 + 45*K where K must be
1.75. I checked the NTIA Red Book and they seem to agree.
Why take just the shift of 170Hz instead of the actual mark/space
tones of 2125/2295 Hz?
Maybe because the slice of spectrum between Fcarrier+2125 and
Fcarrier+2295 is all that is really in use?
I suppose an adjacent channel using different tones on the same
carrier could co-exist......

Depends of if you are PC or Mac user. I use my PK-232 with Mac software and use different applicaitons for various modes. For packet it is hard to beat the old AEA MacRatt, for tcpip us PA2AGA's Net/Mac. I even have mine running on a Mac G4 with a USB to Serial adapter and everybody is happy.

Outgoing messages from people IN the disaster area,
letting folks know they are (or are not) ok.

13,497?

If you mean "local to w0rli" the answer is "All except one fairly
critical linking system have mains-independent power."

Exactly. That is the correct explaination. J2B basically moves the
spectrum of your modulation signal to a carrier frequency, the carrier
is suppresed so it only exists "in your mind" (at least from a
theoretical point of view - in practice the carrier is not completely
suppresed).

I did not follow the earlier post but, anyone who participates in Amateur Radio should not expect privacy....period! If one is interested in privacy then they should stick with digital cell phones or some other form of more secure communications. This is just like that insane argument back when analog cell and cordless phones were first introduce and the ill informed public actually thought no one could hear them. The were apalled to learn people with common police scanners could hear them....if you are a Ham then you should be better informed than that.

By the way any one who openly publishs their location over a radio link, has given up the right to privacy. Ham radio is about open communications not secret squirrel, black ops or what ever one wants to call it. I thunk it is funny the number of people who get on the local repeater to use the phone patch in place of a cell phone and then get indigent over others hearing the boring and usually very trival conversations.

That's right. Your signal is using a 170 Hz shift and 45 baud,
which requires 170 Hz plus the sidebands from the 45 baud
keying, which is the 45*K component. The emission is J2B
so the carrier that you are modulating with the tones is
suppressed.

The actual tones don't matter. You could use a carrier of
14.080 MHz and tones of 2125/2295 Hz; somebody else could
use a carrier of 14.081 MHz and 1125/1295 Hz and you would
both be communicating on the same frequency.

Channels are a completely artifical concept here; the carrier
frequency is continuously variable.

That's obviously correct, but in practice most client devices
are in notebooks ... and they end up being spaced suffiently
far from each other just in normal usage ... as I said, 3-400
people sitting side by side at tables in a hotel meeting room
is common at 802.11 plenary sessions and it works fine.

> >Also, if you only had 3 client devices, why not run them all on
> >the same AP???
>
> This is probably a matter of policy.

I had the idea that this was some sort of contrived test situation.
Using 3 APs where one could do the job is unnecessarily costly
and it also uses 3 channels, which is unnecessarily wasteful of
spectrum.
```

That was the point I was trying to make.

73,
Carl - wa6vse

I think "improved" is clearly a key word ... I also believe that
it needs to be interpreted as "greatly (or vastly) improved,"
not just a slight incremental improvement (like to 4800 bps)
as someone is advocating ... if the EMS folks want (and I'm
sure they do) amateur backup to internet access, I don't
believe that they'd find 1980s data rates to be acceptable.

Yes & no.

Typical scenario: EMS worker polls families at a shelter writing down
their names, conditions and who they want notified. This takes time.
Then (s)he goes to an internet terminal (normal ops) or hands the list
to a ham at a packet station (backup). The list gets typed into a
message that gets sent to some central point where it gets printed out
and manually disseminated.

The times between hitting the "send" are 10x or even 100x longer for
1200 baud packet than for internet - takeing seconds vs milliseconds -
but that is a tiny part of the total transaction. Minimizing that
difference would be better but shaving milliseconds off a process that
takes minutes isn't critical.

Mucho Ham SW only runs on DOS, not (they claim) the Windows DOS prompt.

A Windows geek I know suggested the following mod:

In "Explore" change "msdos.sys" from hidden-read only to make it
accessable

use a text editor (wordpad) to edit msdos.sys
find "option"
Find "boot gui = 1"
Change the "1" to "0"

```
        SAVE
```

Reboot ... computer will come up in DOS-7 from now on

Type "win" at dos prompt to get windoze.

If the softwear is old enough to run in DOS then get an old computer for dos. Those things are almost in the give away price range now.   There should be some old junkers that have a 486 processor in them that people are throwing away. I just threw out one after saving the floppy drive and am about to throw out another that was given to me about 6 months ago.
There is probably plenty of free programs out now that run under windows 95 and up that will do what the old stuff and hardwear used to do.

True enough, but they're usually big clunky QRM'y Desk-Tops too. You
don't happen to be giving away any laptops do you?? I'm putting together
several packet stations for ARES use. The tiny Baypac BP2 modems seemed
ideal but the attendent SW cautioned "DOS" only (not DOS mode) and all
of my laptops run Windoze. So I asked a geek for advice and, having
never heard his solution before, I passed it on.

Try this:

```
    [Options]
    BootGUI=1
    BootMulti=1
    BootMenu=1
```

You will gem a menu on boot that allows you to choose DOS or Windoze.

..

All these options only work with previous-century versions of Windows,
don't they?

A few years ago while mainly using a TNC I had come across this great
program - XPWare. After trying sound oriented ones, I would like to use my
TNC again. Quirk is that while looking for XPWare's site to download, it
comes up dead. Did the owner shut down or is it under another name? If so,
can anyone one clarify me on this? Thanks,

Jacques VE3TSC

My laptop radiates a lot more noise than any recent desktop I've had, at least on HF frequencies.

We have been getting many orders the last week from HamTV customers. I am including some reports written by the Ham Ops about
our units. I really do not know anything tech about our units, I have been in busniess since 1975 in Kansas City Missouri,
I am in closeout business. I own 4,000 Startech Video Sender/Receivers $30 + shipping. www.oshealtd.com

> Preliminary report:
> > I received a Star Tech 910XT-XR Video Sender thanks to Bill Houlehan at
Oshea Ltd. to take apart and see how best to apply it to ATV. These units

are FCC Compliant for license free use on 909.25 MHz and at $30 + shipping
are
> well worth it for just that application. For ordering go to the web
site:
> > www.oshealtd.com
> >
The transmitter and receiver (actually a crystal controlled downconverter)
is designed for plugging in camcorder or VCR composite video and line audio
to the AM transmitter (RCA phono jacks) and receiving through the
downconverter with the F jack cabled to the antenna jack on a TV set to
channel 3.
The system comes with screw in 1/4 wave spike vertical antennas and 12Vdc @
200 ma wall plug power supplies.
> >
The power supplies actually put out 14 to 15 Vdc. In the transmitter, a
12V regulator IC is used, but in the receiver they just used a series
dropping resistor. In either case, 12Vdc battery power could be tapped in
on the output side of the regulator and resistor for portable applications,
or directly from a car with the engine running.
> >
DX with the FCC Part 15 video devices is only a few hundred feet line of
sight. You can't change the antennas or tweak the power for legal
license free operation, but if used as a ham for ham purposes, you can
repeak
the transmitter, remove the antenna system and connect to beams like the
3318LYARM Loop Yagi and should get about 1/2 mile line of sight. There are
many public service events or other applications where this may be all you
need. However for higher power a Downeast Microwave amp could be added -
they have amps that take 10mw input, but more investigation of the
transmitter needs to be done to better match the AM linear input range.
> Bill is trying to get the schematics for me.
> >
I think the best part of the Star Tech system for ham use is the crystal
controlled downconverter. The downconverter outputs on channel 3, has a
preamp stage and a total gain of 18 dB. However, for some reason, the
local oscillator is on the high side which inverts the sideband. This is
no problem for simplex but if used to receive an ATV repeater transmitting
VSB, the desired VSB will be attenuated. It looks like just changing
frequency or going to low side injection should be as easy as putting in a
new crystal and repeaking the two triplers -
that is what I will try next. The crystal frequency is input frequency
input minus 61.25 MHz (ch3) all divided by 9. Crystals can be ordered from
KWMfg.
> > (405 567-2285) - specify KW-18 type crystal and the frequency:
> > 910.25 = 94.333 MHz
> > 911.25 = 94.444 MHz
> > 913.25 = 94.667 MHz
> > 919.25 = 95.333 MHz
> > 923.25 = 95.778 MHz
> >
The transmitter puts out -7 dBm pep which is about right for the 50 mW per
meter at 3 meter license free FCC Part 15 limit these units are
certified for. I was able to get about +2 dBm with a little peaking of the

output filter and some of the multiplier stage trimmer caps. However, the tuning of the multiplier stages greatly affects the video modulation. I could get +8 dBm if I just peaked for max power, but the modulation was unuseable. It looks like they modulated the last tripler stage transistors base. The video also rolls off quite a bit. The modulator is the weak part of the design.

If I can get a schematic soon, I might be able to find a simple solution.If not Ill just have to trace it out when I can get time.... and patience.

The sound subcarrier is also down about -25 dBc, which is quite low - it should be up around -15 to -18 dBc, but this might also be a function of the modulators video high frequency roll off. There are internal video and line audio gain pots on the board.

The frequency can also be changed from 909.25 MHz by changing the crystal and repeaking to the more standard ones used for ATV. The crystal frequency is

> > times 9 in this circuit and the same type as in the receiver.
> > 910.25 = 101.139 MHz
> > 911.25 = 101.250 MHz
> > 913.25 = 101.472 MHz
> > 919.25 = 102.139 MHz
> > 923.25 = 102.583 MHz
> >
> > Both units are in metal enclosures with the electronics in tin plated metal cans inside. The cans come out by removing the 8 external screws and on the receiver, also removing the nut on the F jack. The cover on the can comes off by prying up the tabs. The antenna assembly can be unsoldered from the boards and replaced with coax and/or N connector for ham use.
> >

The receiver draws 40 ma and the transmitter 100 ma with 12Vdc applied.

>
> The receiver channel 3 output has a multipole bandpass filter which is tuned by C20, 21 and 22. For some reason, it was centered on 61 MHz rather than tuned for being flat across channel 3 - 60 to 66 MHz. The high side at 66 MHz was rolled off about 5 dB which would decrease the color and sound subcarriers. A slight decrease in capacity on C20 and 22 brought the passband up to the proper bandwidth and band pass for channel 3. After a little more peaking I was able to increase the total gain to 22 dB.

Below, is another response about article above:

Thank you. Great, he is on the right track and we found all to be as he stated. I will order up a crystal for our desired frequency. Our plan is to operate simplex -- not a problem . Will keep you posted on our findings. Will also check on other hams who are working in The 900 MHZ spectrum.

Having 400 802.11b clients in one room is not much different from just 1
as long as they are trying to access the same AP: only one device
transmits at a time (or at least the others don't want to receive at the
same time), so there is no problem of receivers being overloaded.
This changes if you have several APs. This was my point.
If you suggest to use 802.11b to build a dense wireless network using
dishes, PAs etc. you end up with big problems due to overloaded RF
frontends...

Oh no..... almost thought I was going to see a Dos vs. Windows argument here, kinda like the Pro-Code vs. No-Code. I could see it now..... REAL HAMS USE DOS! or something like that.....

Just kiddin'

Hi all,

Over the last 6 months I have been trying to figure out what to do with my domain... Well, the Digital ham radio bug bit me rather hard two weeks ago when I made my 1st DSP based 2M Packet QSO. I decided to set up a website for my new interest. please take alook at it here: www.radstream.com It is in 'Beta Test' currently so don't try to break it :-) Seriously, the software running there should be robust enough to handly pretty much anything.

Just a few notes:

The default theme is not my favorite! I suggest that after you register and then log in, you change your theme. I suggest the Radical theme because I modified it just for this site. BUT, if you are running Netscape, you cannot use it... Sorry.

The forum software will be installed shortly, not to mention more web themes, etc.

I would appreciate comments or thoughts....

73s and enjoy
Ken Linder

Interesting comment.  Rob, I guess you are not aware of the explosion of packet
activity
with APRS, PCsat, ISS, etc.  Packet is not dead - there are just new, different,
and more
suitable uses for that mode.

Those are not modes that need a new TNC design. A new TNC would be
required to get packet radio on par with wireless networking in the real
world.

That me be what it's like your side of the pond, but this side (at
least in the UK bit of Europe), packet is in rapid decline.

Nick.

I interpreted his comment as something along the lines of "Why
would one want to develop, from scratch, a dedicated ("TNC") type
of device when amateur packet radio (as it was known in the past,
using "TNCs") has become so antequated and irrelevant in comparison
to current industry practice in wireless LANs?"

If I've gotten his sentiment correct, I agree ... the most sensible
development for today's world would be radio modems for the
amateur bands, using modern modulation and coding techniques,
DSP, and the power of PCs (could we be talking software-defined
radio here?) ... such devices would provide the interface between
the PC and the antenna without need for tying up an expensive
transceiver, would be inexpensive, would provide MUCH higher
performance than any packet radio TNC now available, would
to a large extent be reconfigurable to operate new modes as they
are developed, and would use the software stack and applications
(mail clients, browsers, etc.) already provided with virtually every
PC that ships.

Why would someone want to waste their time designing a new
"TNC" ???

73,
Carl - wa6vse

The only thing I would like to see, is a good implementation of a 4800 baud modulator/demodulator. Something that could be driven by TTL, RS-232, or even USB.

I think something that could fit inside of the radio, and easily interfaced to a small computer, would drive thousands of people off of 1200 baud.

4800 is a pretty neat speed for police and fire mobile computers,
and the chips used are cheap and available. I would think a
small PIC based board would improve APRS type beacons
to a system that could actually provide information along with
digital (vocoder) voice.

I doubt that. Several designs of 4800 baud modems have been made and sold for over a decade here, and while they have seen quite some use, they have not caused the majority to move off 1200 baud.

Most people are not interested in keeping up with the state of the art. They'll tell you "it is fast enough for me" and they'll ignore the fact that the channel load would be much less when everyone moved up to a higher speed, even when each individual does not need that speed. Probably they don't even understand what's the problem.

>4800 is a pretty neat speed for police and fire mobile computers,

>small PIC based board would improve APRS type beacons
>to a system that could actually provide information along with
>digital (vocoder) voice.

But who (apart from a few experimenters) will be interested in that?

I have no disagreement with what you are stating, I just think it is wrong to make such bold statements that "packet is dead". I was simply commenting on that to say it is not dead, it just found a new and more appropriate use. Even the chap from the UK that said it is in rapid decline does not seem to be aware of the growing activity in the UK with APRS. The fastest growing APRS program is written in the UK. It would be like me saying that because some hams never use CW anymore that it is in rapid decline and why code test, etc.

Bishop Bradley <bb@nile.org> wrote:
>They said the same thing about single sideband.

But then there was something to gain. Something any amateur would want to have and could not easily get another way.
The goal could be attained by building or purchasing a piece of equipment.

With fast packet, the story is different. Nothing can be done unless a supporting infrastructure is set up (in cooperation with fellow amateurs), and the best you could achieve is some form of wireless Internet. It could be used mobile, but that would mean even more investment in infrastructure.

Now that everyone can get 56k access to the existing Internet, and many can have faster access using cable or DSL, and you can get wireless networking at 11 or 50 Mbps from the shop downtown, what is the attraction of fast packet to the masses?

Rob

... and your view is of course as totally unbiased as mine.

Leaving out the various 'unconnected' packet-like modes for a second.
Can you honestly say that ax25 etc. is in any way a growth sector?

Look at the number of net-nodes that have gone in the last few years.

Take a listen on .950, .900, 8625 et al...   Quiet isn't it. Compared
with 5 or so years ago.

As for APRS etc. Yes when I turn that on here, I still get the same
dozen or so callsign labels appearing. Not a significant number of
new ones though.   Certainly not as many as have been lost from the
other packet mode.

If there is any growing interest in the mode, why has your monthly
column in PW devoted exclusively to packet gone?

Nick.

So the Devil does find work for idle hands !

UK BBS Bulletin traffic rose slightly over the new year period and then went ballistic after 'Harry Blofield' announced the formation of a new national society.

G1NNB went ballistic also, and along with the usual arguments, appeals for calm and denouncements made by third parties, Harry and George seem to be responsible for pushing traffic levels far beyond anything seen last year.

73, Gareth.

(Nick, can't you identify yourself a little better than lucifer@eternal-flames.gov?)

I'm not biased, but I don't yet suffer from the UK packet mailbox network disease, best summed up by "Packet is doomed! Ham radio is doomed! We're all doomed!"

>Leaving out the various 'unconnected' packet-like modes for a second.
>Can you honestly say that ax25 etc. is in any way a growth sector?

The UK mailbox network certainly isn't a growth sector. It was hijacked a long time ago by the "job's worths" of ham radio, it has been over-regulated for years, and any attempts at discussing ham radio topics by bulletin are usually wrecked by the same small collection of people. Sometimes I think you have to be a masochist to use it!

I've used packet since the early 1980s, and I think what has happened to the UK mailbox network is very sad, but, despite that, there are still a lot of users. A change in attitude by a small number of people - the amateurcrats who claim to run the network, the RA officials who don't understand what they're regulating, and some of the users who make using the network an unpleasant experience for others - could make a big difference.

>Look at the number of net-nodes that have gone in the last few years.
>
>Take a listen on .950, .900, 8625 et al...   Quiet isn't it. Compared
>with 5 or so years ago.

Given my comments above, it was inevitable that users would depart to the internet as soon as connectivity became cheap and easy. To survive, the mailbox network needs to offer something that is not available on the internet. That's unlikely to happen when real and imaginary regulations effectively limit message content to what could be carried on RTTY.

>As for APRS etc. Yes when I turn that on here, I still get the same
>dozen or so callsign labels appearing. Not a significant number of
>new ones though.   Certainly not as many as have been lost from the
>other packet mode.

The use of APRS in the UK is most definitely still growing. One attraction, of course, is that it combines ham radio and the internet. Another attraction in the UK is that it allows hams to play packet radio away from all the packet gods / cops on the mailbox network. (Although I notice that, from time to time, some sad old sysop will take a listen on 144.800 and put out a bulletin trying to belittle the APRS users...)

That's something else that they've just about done over here. The new "morse assessment" (N.B. it's not called a morse test anymore), for the Foundation Class of HF licence, allows the applicant to use crib-sheets! According to NG comments, it is virtually impossible to fail.

Nick.

I'm not really talking about fast packet, or networking as we did in the 80's.
I'm talking about a 4800 baud rate, preferably with the input and output
channels on different frequencies. I've experimented extensively with
9600 baud, and it is my opinion that the range per watt (thus the number
of nodes required) is greater at 4800 baud.

While I like what APRS is trying to do, I think it is a limiting protocol. It
is an ASCII protocol, and there is no FEC. Thus, my opinion that the
only way to go, is with 4800. I've used 4800 for years, and it performs
just as well as 1200 baud in range.

What I'm talking about, protocol wise, is something like:

http://www.cmlmicro.co.uk/products/Wireless_Data/CMX969.htm

Which is a a lot of FEC data. Combined with a repeater node, would
be the obvious expansion of APRS data, as well as vocoder data.

> can have faster access using cable or DSL, and you can get wireless
> networking at 11 or 50 Mbps from the shop downtown, what is the attraction
> of fast packet to the masses?

I ran my 1 Mbps RangeLAN2 system from my house to my mobile truck.
The range is on the order of feet. With a beam to beam system, I was
able to reach six miles. Suffice to say, that 11 Mbps Omnidirectional
is a wet dream.

wrote:

>(Nick, can't you identify yourself a little better than lucifer@eternal-
>flames.gov?)

This is (or should that be, was) UseNet.   There is a long, almost
tradition, of not using real email addresses etc. on here.

If it was amateur radio, I could use my somewhat antiquated, early G4
callsign. It isn't radio, so I don't see the point in doing so.

>I don't yet suffer from the UK packet mailbox
>network disease, best summed up by "Packet is doomed! Ham radio is
>doomed! We're all doomed!"

I never suggested that. Though I, like many others will argue that
the road we are presently being taken down in respect of the so-called
Foundation licence class, might well be a doomed a dead-end.

>I've used packet since the early 1980s,

As have I.   From the days of the old 'Acorn' rings in fact - as you
will know, that was, many would argue, the forerunner of ax25.

>Given my comments above, it was inevitable that users would depart to
>the internet as soon as connectivity became cheap and easy.

So when in my original posting, I said that packet was in decline -
that is ALL packet. It was accurate.

>The use of APRS in the UK is most definitely still growing.

But from a much smaller base than packet was at it's height of popularity. The number of existing and new APRS users has not come anywhere close to matching those leaving, or who have already left, packet to go to the internet or PSK31 etc.

That is what the word decline means. Isn't it?

>One
>attraction, of course, is that it combines ham radio and the internet.

But you've just said that users have departed to go to the internet. So if they've already got much higher speed connections - in some cases broadband. Where is the incentive to continue using any form of packet?

>(Although I
>notice that, from time to time, some sad old sysop will take a listen on
>144.800 and put out a bulletin trying to belittle the APRS users...)

Not this ex-sysop I assure you.

Nick.

p.s. I seem to recall having very much this same argument with you, in person, about 2-3 years ago. :-)

If you guys want to argue the merits (or lack thereof) of Morse
testing, you "have" to go to rec.radio.amateur.policy ... trust
me, I *know* about this topic and I've been seriously flamed
for mentioning it on other newsgroups ... :-)

You will never have fast packet.
Fast packet would be too costly to be practical
what would increase packet radio usage is if some clever person could write
some code allowing you to attach a tnc DIRECTLY to windows, say as a pseudo
Ethernet port using the ax25 protocol. This would allow tcp/ip to be simply
set up over radio links. If the local nodes where dhcp servers then no
worrying about where you get your ip address from you just use it. Outlook
express as your mailer, internet explorer browsing simple, non graphical
websites etc DEAD SIMPLE = loads of users, can only be a good thing for the
hobby.......

I ran the link budget calculations for the path from my house
to my employer's closest facility ... a bit over 6 miles ... with

a 20" grid dish at each end, I've got link budget to burn and still have excellent reliability at 11 Mbps ...

With an omni "hub" and directional endpoints, you could get similar range ...

BTW, the notebook at the operating position that I'm writing this message on is linked to the internet (and the hard-wired 100 Mbps Ethernet part of my home office LAN) via an 11 Mbps 802.11b connection ...

I got into wireless before the 11 Mbps stuff came out. I went with
the RangeLAN because it was a 500 mW device, and that combined
with a 21 dB gain dish worked through the path that is not optimum.
If I was to do it again, I'd definately go with a direct sequence spread
spectrum, over the frequency hopper.

> With an omni "hub" and directional endpoints, you could get
> similar range ...

True, but the regulations for multipoint distribution are much more
strict than point to point. I'm talking about Part 15 of coarse, as
nothing ever made it to the Ham bands.

> BTW, the notebook at the operating position that I'm writing
> this message on is linked to the internet (and the hard-wired
> 100 Mbps Ethernet part of my home office LAN) via an 11 Mbps
> 802.11b connection ...

Same here. My router is in the garage, which shoots up to the roof
link on a 500 mW 21 dB gain link via 100 Mbps wire, then to the rest
of the house via 11 Mbps wireless. I don't like drilling holes and
running wires in my old age.

My point was, that take an Omni antenna, and put it on your truck.
Say you have an Omni hub at 50 feet. How far can you go before
the link craps out? In my case, I had a radius of way less than a mile.

Thus, in my opinion, low baud 4800 is the way to go for maximum
coverage at affordable prices. I'm not talking about TCP/IP.
TCP/IP mobile in my truck has zero value for my ham radio hobby.
I want something that is purely "shoot the breeze" and "just for fun."

Such low speeds can make sense for some applications, provided that the system is running in full duplex. This improve throughput by eliminating the TxDelay.

With full duplex it is not possible for multiple stations to directly communicate with each other but a common repeater is required. This is very fortunate, since this eliminates the hidden transmitter problem and some sensible channel access systems can be used.

Using a common repeater also makes it possible to use directional antennas at distant end user stations, which has traditionally resulted only in a worse hidden transmitter problem.

With a single common repeater, the end users always communicating with the same station, thus it would be possible for each end user station to use an equaliser in both the receiver and transmitter to correct the phase and amplitude response of each end user rig, although, this could not compensate for variations in the RF-path (multipath), unless frequent training sessions are used. However, with an equaliser, higher speeds, 9600bit/s and possibly more should be obtainable using a sound card for handling baseband Rx and Tx signals.

The problem with full duplex is that the receiver will desense from the own transmitter, unless a duplexer is used. This would be too expensive, if every end user station would need a duplexer. Fortunately, there are a lot of dualband radios capable of simultaneously receiving on one band and transmitting on the other and provided that the frequencies are selected in a way that are not directly harmonically related, there should not be too much desense problems.

In the simplest case the repeater could be just an ordinary phone repeater for simple AX.25 style CSMA channel access, but for other channel access methods and for using equalisers, some additional logic is required at the repeater site.

Exactly! So it shouldn't need much else to persuade hams to use it. One problem here in the UK is this - The network has been over-regulated for so many years that the ham radio aspect of using it has become unimportant.

The most common reason I see quoted for using the packet network isn't "Because it's ham radio..." it's "Because I haven't got internet access...", which is a road to nowhere.

Of course we need to emphasise that it's ham radio, that it provides a unique forum where you can discuss thing with other hams, etc, but some of the people who run it also need to get their brains in gear, and realise that years of saying "Thou shalt not" have done serious damage.

You mean like SV2AGW did a couple of years ago?
Did that take over packet radio?  It has quite some users, but not the
loads of users you predict or expect.

>problems.

The practical one-band implementation is to use a repeater with full-duplex
capability (including filters to shield the receiver from the transmitter),
and user stations that are only half-duplex.
The repeater has a channel access protocol that forces the users to
transmit only when the channel is free. I.e. it transmits grants to the
users to use the uplink channel one by one. As the repeater can hear

everyone, it can poll them one by one to transmit to it. It can also transmit other information while it is receiving, as long as it is careful not to transmit information to the station it has just invited to transmit. (under the assumption that this station will not be able to receive while it is transmitting)

This protocol is known under the name OPTIMA (an extension of DAMA) and is in actual use in some stations.

The idea of using some central arbitration in situations where a useful arbitration system is available (like in the case of a duplex repeater) has always been appealing to me. However, what I don't like is the DAMA implementation: the channel access protocol is intermixed with the AX.25 connection protocol. This means that it is not suitable for use with UI frames, as in the case of TCP/IP and APRS.

I have once designed a channel access protocol that really sits below AX.25 and could be used with UI frames and with other protocols. It uses short frames with only the callsigns as a poll frame, and allows the polled station to send anything it likes to send, not only connected mode AX.25 frames to the poller. (so it could also be used to arbitrate communication on a simplex channel: one central system could arbitrate the transmissions, but the actual data could be sent from one peer to another, not via the central system if that is not required).
This is a cleaner and more versatile approach than DAMA. Like on ethernet or token ring: the actual media access protocol is not interwoven with the higher level link protocols. I did a simple implementation, but abandoned the idea once it was clear that it would not stand a chance against the widely used DAMA protocol.

A friend of mine wants to operate this combination. Rumor has it that the TS-570's DSP may delay the signal beyond the limit imposed by the PACTOR protocol. Personally I don't think this is true. A short statement by someone successfully using this combination is appreciated as final proof that the above rumor is wrong! TIA.

That is my point. The reason to use ham radio is ... surprise ...
because it is radio. Not because of some specific content, not
because it is "just like the internet" but because you hook up
your radio, build antennas, make contact with other hams ...
via radio.

> Of course we need to emphasise that it's ham radio, that it provides a

Who cares about "unique forum" ... ham radio is not a unique forum
in any way other than you do it via radio. That's the whole point.

Tell that to the guys in Slovenia who have been running >11 Mbps for at least a couple of years.

A further example would be the cost of IEEE 802.11b PCMCIA cards, which are going for WELL under $100 street price now.

Fast packet is NOT beyond reach, either in technology or in cost for the amateur community.

What seems to me to be lacking is an accurate understanding of what is possible.

The point I've been trying to make, obviously unsuccessfully, so I'll shut up after this, is that I think there are reasons why a good number of users have stopped using the UK packet mailbox network. And I don't think they are going to return just because you or I say "the reason to use packet is because it's done via radio".

Note - All my comments have been about the UK network. I don't think the situation is necessarily comparable with the network in the USA, because you lost users long before we did, and you don't have our regulatory system.

Hmmm .... "Cambridge Packet". Around 1983-84'ish ? It used the cassette port on the BBC micro - as well as Tx & Rx audio, it had a 'remote start' for the cassette recorder - which made a very handy PTT line.

I admit that I first explored 'packet' via the Cambridge method, but AX25 version 1.1 was adopted in October 1982, a little while before "Cambridge Packet" arrived.

Around that time, BARTG used to publish a list of known UK users of AX25 in their newsletter. I think there were some forty-ish souls by 1985.

Unfortunately many ham radios require quite a while before the PLL is stable and the transmitter has been turned on (several hundred milliseconds). On 1200 bit/s AX.25 this is not a problem, since the largest frame takes more than 2 seconds to transmit, while at 9600 bit/s, the longest frame takes less than 300 ms and a shorter frame even less. Even with a window size of 7, the TxDelay will consume quite a lot of the channel capacity.

Thus, it would be preferable to let the user radio transmit as long as it has the token (in a token ring system).

Paul OH3LWR

I see.   So when I say UK packet radio is in decline - I'm wrong.

But it's okay for you to say that "a good number of users have stopped
using the UK packet mailbox network......"

Well. I'm very glad we've got that point clarified.

Nick.

I used the word in my posting, in exactly that meaning.

Acorn (or Cambridge) rings, were not that difficult to set up and it might be argued generated a surge of interest in, followed by a switch to, 'real' ax25-type packet here in the UK.

I was NOT claiming that Acorn rings, predated packet.

Of course...
But transceivers with several hundred milliseconds txdelay are not really suitable for packet.

Transceivers that do not have that problem are available (TEKK, several German designs, crystal-controlled surplus PMR units).
However, for 70cm and below these normally cannot duplex in-band.
(for 23cm this usually is no problem)

In this case, the described system should work quite well. Of course, you also want to use a window well above 7.

Rob

Pardon me, but "Gag!!!!"

Several hundred milliseconds for a PLL to settle? That's AWFUL!!!

The chipsets I designed for $50 (retail) cordless phones
several years ago would lock and settle the PLL on a jump from
one end of the 902-928 MHz band to the other (~ a 26 MHz step ...
the settling time was faster for smaller steps) in 250 *micro*seconds,
worst case. (This was settled within less than 5 kHz, and the
remaining
settling of the last "ringing" was completed in another cycle or two
of the reference frequency to essentially "dead-on stable.") This
lock/settle time/accuracy was adequate for good deomodulator
performance with the modulation used ... in this case orthogonal BFSK
with +-80 kHz shift for 160 kbps burst rates on the channel.

Again, I must emphasize that this was in a chipset economical
enough to for a $50 (retail) cordless phone (2 complete radios,
plus baseband, etc. ... one set for the base, one for the handset.)

It IS possible to design low-cost/high-performance radios that
could be used in high-speed amateur digital communications
systems in the VHF/UHF bands ... and it is NOT necessary to
limit one's self to xtal control to get adequate switching speeds

to support higher data rates without having TX/RX times eat up
all the channel time.

I have to ask again "Why would one want to bother with designing
a new "TNC" for 4800 bps???" (for that matter, why would one
bother desiging a "TNC," as opposed to a true RF modem
and running the "stack" on the PC???)

Of course it is possible to make a fast PLL (especially when you don't need small steps), but you should understand that the PLL in an amateur radio transceiver is purposely made slow.

FM transceivers have only a single PLL. When receiving, it is set to Frx - Fmf1 to provide the local oscillator frequency. When transmitting, it is set to Ftx. The output of the PLL is directly fed to the power amplifier stages. It is modulated by AC-coupling the amplified microphone signal to the VCO control voltage.

With a fast-acting PLL this would not work, as the PLL would counter-act this modulation signal. So, the PLL loop filter is set to cut of at 50 Hz or so, the PLL cannot track (most of) the modulation, and it sort of works for voice.

However, a PLL with a 50 Hz loopfilter is of course not going to lock in 250 microseconds...

A better design would keep the PLL at Frx frequency and mix a separately modulated oscillator, operating at Fmf1, to obtain the Ftx. This is usally done in SSB and multimode transceivers, as it is required (or at least easier) to obtain an SSB signal this way, and do it the same for FM mode.

With so many amateurs wanting to use a small and cheap FM-only mobile or handie for packet, slow changeover times are a fact of life.
It is clear that the whole idea of using a voice transceiver for packet was a bad idea from the start. Strange that the wellknown manufacturers never came up with an amateur packet transceiver, something that has no voice mode but is optimized for data. These things have always remained kit-form or module designs, not plug&play devices from the far east.

Rob

Yes, please, I'll take a bunch of those.

An RJ-45 connector with 10 or 100 base T to talk
to the computer would be very nice.

I want to hook a bunch of those to an ethernet
hub out where the antennas are located. Two locations
actually, one is 100' from the shack, the other is 500'.

I don't like the term TNC. It doesn't mean anything anymore, or is synonymous with AX.25. Ham radio is done with that as an attraction.

Let's call it a modem. Digital data in (I don't care how, TTL is fine), and audio out (audio that can be interfaced to a radio).

4800 baud carries vocoder voice. 4800 baud has good coverage per repeater. 9600 baud repeaters are short range devices in comparison (using the g3ruh design), or requires a beam. Don't try to sell me different. g3ruh modems are terrible designs.

4800 baud modem chips are available that do 4 level FSK and built-in FEC. Vocoder chips are available that also have FEC built-in, and would be fine for plain old FSK.

4800 baud is fine for APRS combined with voice. Higher baud rates require more nodes, and have smaller coverage area.

Part15 devices running 11 Mbps have no value to a Ham. It's an unlicensed commercial design, and operates outside of the Ham bands.

Hams no longer want to duplicate the internet. Trying to interest a Ham in high speed megabit wireless is a no gain exercise. Hams don't want another internet. They want to use GPS and voice, or other low bandwidth information. They don't want to email or ftp.

Just to add a couple non-technical thots ...
1) My hearing is "profoundly impaired" so I'm planning to do more
"digiting" as soon as I can find a round tuit.
2) We did a demo for our county emergency folks a while back. They were
much more interested in packet than voice cuz it yielded hard copy they
could reference and didn't garble lists of names like speech tends to
do.

Both argue for ongoing improvements.

A modem is not the same thing as a TNC. A TNC *contains* a modem, but
contains a lot of additional features as well, in the form of hardware
and software to control your station.

Granted that the amateur stuff could still be slow, but there's another factor here: Your cordless phones put out less power than amateur equipment. For usable communications, the signal out the FINALS must be stable, and the higher the power, the longer it takes for the signal to ramp up to that output level from zero. Nothing is "instant on." Now, a fair comparsion would be of FINAL signals, or of VCO lock (in the driver circuit where the power level is more likely to be approximately equal).

To address the discussion on another newsgroup (cross-posting added) and this above comment to Carl Stevenson about part15 on 12cm: Gee - I wonder how he came to that conclusion? He must have read the box! As I have said, there simply isn't enough information out there for the non-radio-engineer amateur operator to realize that this belief is technically wrong - because the fact of a 20MHz slice of the band isn't evident to those who don't take the extraordinary step of looking up the IEEE 802.11b specification.

I discount you because you are involved in the design and/or manufacture of such devices. I discount Ed Hare because he is involved in the survey and testing (for interference purposes) of all wireless devices. [However, both of you seem knowledgable on the subject, but you are EXPERTS.] I have been talking about the AVERAGE PERSON. Not every amateur operator is an electronics engineer.

You will have small pockets of specialist packet users in some areas. But
unless someone produces a magic way of making tncs AND radios cheaply that
conform to 12.5 KHz channels AND speeds of 9k6 and up AND get the sysops to
upgrade their user ports AND keep signal levels high enough that the retry
rates don't make the whole thing slower than 1K2 GLOBALLY over the whole of
the UK then off you go impress me, and incidentally, why didn't you do it 15
years ago if you can do it now, the technology IS that old...

I bet they have TOTALLY different environmental situations to here in the uk, Do you realise how hard it is to shoehorn a new node/frequency into the existing network?

Or are you suggesting that we scrap everything and start a new system?

Mark...

I had a discussion with my father (an old time HAM - VE2EJF) weither ham radio was dead, in fact he was trying to convince me to take a ham radio license. He was saying that while this is true that cellular phones and Internet made two major parts of the ham world (mobile voice communications and very long range communication) obsolete, ham radio had still a great potential: mid range high speed Internet.

Existing cheap wireless ethernet only has a small range (100-300 feet) and you need to buy expensive equipment for mid range (15-30 miles) wireless networks.

I personally think that this could make ham radio very popular again: this could solve the last-mile problem with high-speed Internet; this would be a great incentive for geeks to get their ham radio license.

I'm a 3rd year Computer Engr. student and I'm mainly interested in computer programming; but knowing that I could make a mobile high speed (2-5 Mbps) computer network by taking my ham radio license really makes me want to do it.

BTW, you can get a GPS receiver for 200$ and you can get voice and low bandwidth communications with a 50$/month PCS; you don't need a ham radio license to do this. I always believed that ham radio was about doing more than the commercial equivalent could do.

Regards,
GFK's

i have to agree with the earlier post,

if you are worried about privacy, you may not find it in amateur radio or APRS. read the back of your license, "The station shall be identified by the call sign specified herein and shall be available for inspection upon request by an authorized Commission representative."

that sounds an awful lot like, " don't need a search warrant, we can violate your fifth ammendment rights anytime we want." it seems as if privacy is not a major concern.

Aprspoint is available as a complete solution now, with MapPoint 2002 included. Aprspoint is an implementation of the latest APRS standards, and MapPoint offers high quality detailed street level coverage for North America and Europe. Now you can get both and do APRS in addition to address searching, route planning in one integrated interface. The package is very affordable, Aprspoint Plus MapPoint 2002 costs $129.90. And first 500 orders get an additional $20 off!. Check out the details at www.aprspoint.com.
Thanks.

Apparently there has not been sufficient demand for such devices, otherwise, there would be competing models to the Kenwood HT+TNC combo from other major ham radio manufacturers and thus, a reduction in the prices.

To be realistic, there are people who are interesting in homebrewing their ham radio gear and there are people interesting in networking, but the number of people who are interested in both subjects is quite low. To activate those interested in networking but not interested in homebrewing (or those not confident in their SMD assembly skill), clearly commercially available units are required. But as I said, there does not seem to be enough interest in order to attract hardware vendors.

Such low speeds (1200/9600) are perfectly suitable for many portable activities, such as APRS and voluntary search and rescue operations in the wilderness or monitoring the DX-cluster everywhere. For such operations, it is important to be able to quickly set up the station, so something like a laptop+HT or even a standalone unit would be preferable.

Any larger data rates require a more or less fixed user stations, so that directional antennas can be used to avoid the problems due to long distances due to the low ham density. At higher data rates the severe problem of multipath must be addressed in some way. It is not possible to just use the traditional modulation methods (FSK/PSK) on narrow channels (10-100 kHz), but instead use TDMA, DSSS or COFDM to multiplex multiple channels on a wider frequency range.

Unfortunately, none of the old equipment is usable, so you would have to start from scratch and worst of all, this would require some new thinking (which unfortunately is a rarity :-) within the ham community.

I'd go along with that ..

> Let's call it a modem. Digital data in (I don't care how, TTL is fine), and audio out (audio that can be interfaced to a radio).

You were doing fine until you said "TTL" and " audio out (audio that can be interfaced to a radio)."

One of the primary reasons that amateur packet (or amateur computer-computer) communications has stagnated so badly, compared to "the real world" is the entire paradigm of interfacing to radios designed for audio service is so horribly limiting.

[snipped stuff about 4800 and 9600, since I think such slow rates are essentially a waste of time and bandwidth]

> Part15 devices running 11 Mbps have no value to a Ham. It's an unlicensed commercial design, and operates outside of the Ham bands.

Not so ... devices built to the IEEE 802.11b standard operate at 2.4 GHz and cover our allocation there (and then some ... you have to select a channel which falls in our band) ... other than that, I see no particular problem with applying them directly.

> Hams no longer want to duplicate the internet. Trying to interest a Ham in high speed megabit wireless is a no gain exercise. Hams don't want another internet. They want to use GPS and voice, or other low bandwidth information. They don't want to email or ftp.

I do ... I can see tremendous value in providing an alternative network that's not dependent on the wired infrastructure of POTS dialup, DSL, cable modems, etc.

Imagine the public service/disaster value of being able to tell the local emergency management agency "Your computer connectivity to the outside world is down? Gee, we're sorry to hear that, but if you'll let me attach this box here to your Ethernet LAN, I can give you at least a T1 equivalent or more."

Also ... packet, as it now exists, has lost its appeal because it can't compete with even a V.90 dialup to your local ISP for things like messaging, file transfers, etc. If it could surpass that and equal, or even exceed DSL and cable offerings, more people would (I believe) find the use of the radio option more appealing. (as is is now, it's so painfully slow that it's downright boring and frustrating)

73,
Carl - wa6vse

Agreed, Walt ... but most of that additional hardware and software
is/could_be/should_be rendered obsolete by software (including
the existing TCP/IP stack) on your PC ... all it does is provide an
arcane user interface designed for the "dumb terminals" of years
ago and increase the cost and complexity of a low performance
device.

system?

Not exactly scrap it outright overhight, but essentially yes ... I'm
suggesting
that systems with large improvements (and I don't mean 4800 or 9600
...
I mean much faster) be phased in rapidly. Ultimately, yes, the
existing
systems will end up being scrapped. It probably should have been done

a number of years ago, but that's water under the bridge.

As an example ... are you still running an 8088-based PC and and
early version of DOS?

I doubt it ... significant advances in technology have made it
possible
to have much faster CPUs and (some will probably disagree :-) more
user-friendly operating systems at affordable costs.

The same level of advancement has taken place in digital
communications
in "the real world" ... but the ham community has remained stuck in
the
DOS-equivalent time-frame, technology-wise.

One of the phones based on the chipset I mentioned put out 1/4W.
The TX/RX time, including PA ramp was small compared to the
PLL settling time ... thus I would still maintain that several
hundred
milliseconds turn-around time sucks.

The point that someone made about part of this being (in voice
radios) due to restricting loop filter bandwidth so the VCO can be
modulated on TX is true, but that's just another compelling argument
against continuing to try to stuff data through radios that were
designed for FM voice.

This is not easy at all. Doing direct FSK modulation is easy, the hardware is available and we don't have to care much about the power amplifiers as they can be non-linear.

On the other hand (at least here in Germany) we have to care about spectrum usage. Eg. on 1.3GHz we have 50kHz wide channels allocated for

packet radio links and on 2.3GHz they are 250kHz wide. With binary FSK this gives you about 20kbit/s or 100kbit/s, which is not really much faster than the 4800bit/s you mention.
We could go for M-FSK which makes things a lot more complicated, or we can go for PSK/QAM. But this demands highly linear power amplifiers...
(we modified the "famous" 15W PA module for class-A operation and were able to get about 2-3W out for filtered QPSK...).
The MBit/s everybody dreams of are not achievable in this tight bandwidth. And it is no option to "just do it" like the Slovenian Hams do it. For them it may be ok to have a 1MBit/s link need 5MHz bandwidth, but that is definitly not the case in a highly populated area in Germany where you have only limited bandwidth (and probably also not in the US).

Spread Spectrum does not really help, it only makes bandwidth allocation a bit easier (so you don't need to "plan" the usage of the frequency spectrum). I predict that in 2 years from now latest you can't operate a 2.4GHz wireless link for over 500 meters anymore in a lot of areas because the band is "crowded". We did a test with 3 802.11b WLAN adapters in one room and they simply won't work... 2 were ok, the 3rd one needed an antenna seperated from the others.

So until someone invents something that is as easy to use as the technology we have now, we have to face the fact, that we will have to stick to the speeds we have now.
(plus of course the fact that the people how may invent this technology are not interested in packet radio anymore)

73' Alexander DL8AAU/AB0CF

You must be very lucky to have multiple ATV-repeaters and other wideband activities in every town, otherwise, I can't see how you will get crowded amateur bands above 1 GHz :-). In a highly populated area, there is no need for a service radius of 50..100 km, there are going to be plenty of users even if the radius is a few kilometers. Just install the node antenna at some ordinary building (not on a high tower), thus the frequency can be reused in a nearby town.

>Spread Spectrum does not really help, it only makes bandwidth allocation

This automatic allocation handles the local requirements in different places with different population and usage patterns more nicely than any fixed allocation system.

>I predict that in 2 years from now latest you can't operate a
>2.4GHz wireless link for over 500 meters anymore in a lot of areas

Why should you be able to use 802.11b WLAN devices for such long distances in a crowded area, when there are plenty of opportunities to move the traffic into a wire and thus reuse the frequency. In a less crowded areas, the background noise levels are lower and longer distances are possible, exactly where you need it, thus, the system works just as it should.

Huh?   I've been in rooms with an access point and a dozen or more laptop users all accessing the net using 802.11b.   No real problems. The cards did need to be told that the access point density was high.

A typical scene at USENIX in Boston last year were 6-8 people sitting at a table, all with laptops connected to the net via 802.11b.   The AP was several rooms away.   All users were within 2 meters of each other.   Again, no problems.

There is 2 * 1MHz space for links on 23cm in the bandplan, so there are
just 20 channels. When you have seen a linkmap of Germany you will
understand that 20 channels leave very little room to work with. Some
nodes have >10 links to neighbors. The height profile of the country
allows some very long distance links between mountain peaks, while at
the same time there are links from those peaks to nodes in nearby valleys.

Here in the Netherlands the situation is a bit simpler (flat country,
links can only reach about 60-80 km), but still the channels of the
first 23cm link bandplan, with 100 KHz channels, were quickly allocated
and 50 KHz channels required.

(the band is 60 MHz wide, but there is also weak signal DX, FM voice,
repeaters, and a couple of ATV repeaters. and of course the satellite
band. and a large section of the band is unusable due to ATC RADAR)

Rob

The static IARU band plan may be justifiable on HF due to the global propagation (and satellites on higher bands), but the result of allocating a sub-band for every thinkable mode is a very inefficient use of the spectrum. On bands with more limited propagation, such static band planning does not reflect the local actual usage.

>(the band is 60 MHz wide, but there is also weak signal DX, FM voice,

The combined weak signal, beacon, FM simplex and repeater output cover a huge 2 MHz.

>repeaters,

The phone repeater inputs cover an additional 0.5 MHz.

>and a couple of ATV repeaters.

Do you have ATV repeaters in every town ?

In fact it might be interesting to use ATV repeaters for some digital data transfer experiments by imitating the structure of the TV-signal (remember the ancient Sony PCM-1 add on box that was used to record digital audio on a standard VCR).

>and of course the satellite band.

Which is 10 MHz wide, of which only a few hundred kHz is actually used by any satellite receiver.

>and a large section of the band is unusable due to ATC RADAR)

That _should_ not be a problem.

With suitable modulation methods and interleaving and ECC this should really not be an issue.

Amateurs have quite large microwave frequency allocations and the reason for this is that on most of these bands amateurs are secondary users, while radio location (radar) is the primary user and no other service wants to be on the same band with radar :-). With some ingenuity (noise blankers, code interleaving) amateurs could coexists quite well even with such hostile primary users as radar.

Paul ... this is uncanny ... I read a "reason why it won't
work," think of a response, then skip to yours and we're
"on the same page" ... you're saving me a lot of typing :-)

These guys should see a plenary of IEEE 802.11
... literally hundreds folks in several adjacent, huge
hotel ballrooms, sitting as you say, right next to each
at tables with their notebooks, banging away doing
downloads of the meeting documents, running e-mail
through VPNs, etc.

And while that's going on, there may be people sitting
outside the meeting rooms with their notebooks in
the lobby/atrium/or restaurant ... whatever the area's called,
and they're doing the same thing ...

If the hotel has the large, open central "atrium" layout of
many modern hotels, folks across the way on lower floors
often can access the network APs in the meeting rooms
from their hotel rooms ...

Yes, it does work, and the number of users/density that
it can handle is quite astounding proof of that when you
see it for the first time.

OTOH it makes it more likely that amateurs can inter-operate during
periods of better propagation. e.g. SSB and CW users often can tune
over a limited range (limited by their typical transverter+lower band
transceiver setup) so it is good when they all meet at the same QRG.

Also, the primary (or other secundary) users of the bands often want to
have a say in the placement of permanent or unmanned transmitters. The
band planning of repeaters and packet links is coordinated with the
authorities, although in most countries more like "you cannot put repeaters
at this band segment" than the other way around.

>>(the band is 60 MHz wide, but there is also weak signal DX, FM voice,

>>and a couple of ATV repeaters.

>Do you have ATV repeaters in every town ?

Not in every town, but yes, we have ATV repeaters in or nearby many
cities. I think there are about 10 of these in our small country.

And you must not under-estimate todays ATV repeaters!
The one in the neighborhood here, which is mid-range when compared to others, has:

- two transmitters on 3cm
- two user receivers on 3cm, two on 13cm, one on 23cm
- several receivers for receiving other repeaters and sysop links
- telecommand and audio talkback receivers on 2m and 70cm (and 23?)

In fact they are more complicated than most packet node / bbs systems.

>In fact it might be interesting to use ATV repeaters for some digital
>data transfer experiments by imitating the structure of the TV-signal
>(remember the ancient Sony PCM-1 add on box that was used to record
>digital audio on a standard VCR).

Well, the ATV repeaters here are far from transparent. They have a digital multi-picture matrix (which puts all the inputs in one output as smaller pictures), a teletext inserter, up to 7 analog audio subcarriers, and a NICAM audio carrier.
The multi-picture unit can be controlled and your own transmission set to fullscreen, but indeed you would need to mimic a real TV signal very closely to allow these repeaters to relay it. They aren't like transponders...

>>and of course the satellite band.

>Which is 10 MHz wide, of which only a few hundred kHz is actually used
>by any satellite receiver.

The local repeater already receives in the 13cm satellite band. When AO-40 was launched I planned to contact the operators about that, but now that it is not as successful as it could have been there is no real problem.

>>and a large section of the band is unusable due to ATC RADAR)

Then why would that not be true for other users, who generally are far ahead of radio amateurs w.r.t. these techniques?

Rob

For sale: Paccomm 56K WA4DSY "GRAPES" modem + cable
for PI/2 card. In excellent condition. $275 shipped to lower 48
states.

Also Microwave Modules 10 meter to 222 transverter used with above
items + cables. In excellent condition. Includes extra crystal for
use on 218-219 MHz fixed link band segment. $150 shipped with
purchase of GRAPES modem; will not sell separately until modem is
sold.

Call Jim at 716-381-3102 (evenings before 9 PM) or 716-231-2417 (work)
or email to ZZZjim_cronin@juno.comZZZ
(remove ZZZ on front and back to reply.)

73,
Jim

The two megahertz wide narrow band / weak signal segments (e.g.
1296-1298 MHz) have been created on all microwave bands exactly for

this reason.Those people using these segments are often very interested of using these rare abnormal propagation conditions.

There are an additional 58 MHz of bandwidth on the 23 cm band, which could be utilised for various other things. Most wide band users are more interested in predictable communication and consider those abnormal propagation conditions often as a nuisance.

>Also, the primary (or other secundary) users of the bands often want to
>have a say in the placement of permanent or unmanned transmitters.

True, but since many systems need a full duplex system, it would be natural to put the repeater inputs at these frequencies in a high location, while the users run their transmitters at much lower locations, thus reducing the risk of interfering with the primary user. A fixed worldwide or region wide amateur radio band plan would harm such creativity.

>>Amateurs have quite large microwave frequency allocations and the
>>reason for this is that on most of these bands amateurs are secondary
>>users, while radio location (radar) is the primary user and no other

I think that most have noticed how eagerly various manufacturers create all kind of appliances (e.g. WLAN) running on the "license free" ISM bands, where they have to tolerate all kinds of interference? In order to be able to operate in such hostile environment, various modulation and coding methods are used to combat the unpredictable interference.

Getting a secondary status for some new service e.g. on a radar band will take years, especially if a worldwide market is planned (due to the slow WRC cycle) and the primary users might protest wildly, thus, developing a radar resistant new service would be a quite risky business.

The channels and subbands discussed up to now are for inter-node links.
They are at the band edges, and are used with 59 MHz shift.

For users, there are 3 other bands: two at the edges and one in the
center of the band. They are used with 28 MHz shift, and the channels
are staggered (positive and negative shift) in a manner compatible with
what you write above.

>I think that most have noticed how eagerly various manufacturers

>the unpredictable interference.

I think that was quite irresponsible and fortunately now the 802.11a standard systems are appearing that use an allocated band.

Investing in lots of equipment operating in an ISM band is not very wise, imho... when it is a big success, nobody can use it anymore.

Rob

Amateur Radio Newsline™ Report 1277 – February 1, 2002

Amateur Radio Newsline report number 1277 with a release date of Friday, February 1st, 2002 to follow in 5-4-3-2-1.

The following is a Q-S-T.

The President of the United States speaks to hams in Florida and is ham radio seeing a second Solar Max? These stoies are first on amateur Radio Newsline report number 1277 coming your way right now.

(Billboard Cart Here)

**

BREAKING NEWS: PRESIDENT BUSH COMES TO HAM RADIO

The President of the United States has come to ham radio. Bill Burnett, KT4SB, has the details:

--

President George W. Bush has taken to the ham radio airwaves. This, to thank the Florida Amateur Radio community for being ready to serve the public when it is needed.

The President’s comments were made during a stopover the morning of January 31st at the Volusia County Fire Services and Training Center near Daytona. Around 9:15 AM Eastern Time, President Bush checked in to the Northern Florida Amateur Radio Emergency Service Net on 3.950 MHz using a portable station set up John Schmidt, AF4PU. Then the President made these remarks to the 40 or so stations listening to the net:

--

President George W. Bush:

"I want to thank all the volunteers who help make sure that Florida is prepared for any kind of emergency. I also want to assure you that your Federal government is doing everything we can to make sure that there is not an emergency--starting with unleashing the mighty U.S. military overseas to bring evil ones to justice. But should there be a need for a response, I want to thank you all for helping our communities be prepared. And finally, I want to tell you--we are lucky to be Americans and may God continue to bless this great land of ours. Thank you very much."

--

Needless to say the net members were delighted to have the President of the United States address them. More important, hams nationwide can now be sure that President Bush knows that Amateur Radio operators are ready to serve whenever he, and the nation, needs to call on them for help.

In Miami, I’m Bill Burnett, KT4SB, reporting for the Amateur Radio Newsline.

--

The complete story is on the web at http://firstcoastcommunity.jacksonville.com/northfloridaamateurradiosocietynofars (Tnx NU4F, CQ Magazine)

**

HAM RADIO SCIENCE: TWO SOLAR MAXIMUMS THIS SEASON

In case you are wondering why the current solar cycle is still providing such amazing VHF and UHF DX, one researcher may have the answer. He says that the current cycle appears to be having a second peak and that this is really not very unusual. Henry Feinberg, K2SSQ, looks at the scientist and his latest data.

--

The most recent and ongoing Solar Maximum -- or Solar Max -- theoretically crested in mid-2000. Sunspot counts were higher than they had been in 10 years, and solar activity was intense. One remarkable eruption on July 14, 2000 caused brilliant auroras as far south as Texas. But after that, sunspot counts slowly declined and the Sun was relatively quiet for month-long stretches. Most scientists said that the Solar Max was over. But was it?

Now, as 2002 unfolds, the National Aeronautics and Space Administrations solar foorecasters say that it looks as if the Solar Max is back with us again. The Sun is again peppered with spots, eruptions are frequent and hams notice that the VHF DX keeps rolling in.

Why is this happening? Well David Hathaway, a solar physicist at the NASA Marshall Space Flight Center in Huntsville Alabama has one theory. Hathaway says that the current solar cycle appears to be double-peaked, and the second peak has arrived.

--
Hathaway Audio Here
In-Q: We have seen other cycles...
Out-Q: ...define this maximum
--

Scientists track solar cycles by counting sunspots and Hathaway is an expert forecaster of sunspot numbers. He says that sunspot counts peaked in 2000 some months earlier than we expected. He says that the subsequent dip toward solar minimum seemed premature and before long, sunspot counts reversed course and began to climb toward a second maximum that now appears to be only a few percent smaller than the first.

--
Hathaway Audio Here
In-Q: Its a bigger than average...
Out-Q: ...smaler than 19, 21 and 22.
--

Hathaway notes that there is a widespread misconception that solar activity varies every eleven years like a pure sinusoidal wave. It isn’t. He says that solar activity is chaotic and there can be more than one peak in any given period. Translated for ham radio: Enjoy the VHF DX while you can.

For the Amateur Radio Newsline, Henry Feinberg, K2SSQ.

--

Hathaway says that the Solar Max eleven years ago was much the same as this one. The first peak arrived in mid-1989 followed by a smaller maximum in early 1991. And if you are interested in hearing more about this interesting phenomena from David Hathaway its as easy as taking your web browser over to www.rainreport.com. Or you can call on the phone to area code 847-827-7246. (NASA, RAIN)

**

HAM RADIO IN SPACE: HF ANTENNA INSTALLED ON ISS

High Frequency ham radio operations from the International Space Station could be on the not to distant horizon. This, after a successful space walk on January 25th to install another antenna on the orbiting outpost. Amateur Radio Newsline’s Roy Neal, K-6-D-U-E, has the details.

--

The spacewalkers have had another good day in space. On Friday the 25th of January, Cosmonaut Yuri Onufrienko, RK3DUO and Astronaut Dan Bursch, KD5PNU, successfully mounted a second ham radio antenna near a docking port amidships on the International Space Station. It is made of flexible tape and is similar to but longer than another antenna installed on January 14th. That one tunes both VHF and UHF frequencies. The new antenna will tune HF frequencies.

ARISS Board Chairman Fran Bauer, KA3HDO, says it definitely will work on ten meters and may even be made to work on 15 and 20 meters. BUT right now there is no gear on board to handle those frequencies. Experiments using the lower frequencies are on the list of futures for ARISS but no timetable has been assigned to design and build them.

Owen Garriott, W5LFL, the first man to operate ham equipment in space, once prophesied that a five watt transmitter in orbit might well be heard simultaneously world wide. The great number of hams with good stations on the lower frequencies also makes them enticing to ARISS. It's a safe bet that serious consideration now is being given to expedite such a project. Once a station is sent up, the antenna will be waiting.

The new antenna is the second of four to be installed on board the space station. No timetable has been announced for the final installation. All of these amateur antennas were built by Italy, tested and qualified in the US, to fit ports built by Russia, as befits the international nature of the ISS.

For the Amateur Radio Newsline, Roy Neal, K6DUE

--

Installation of the 2.5-meter long flexible tape antenna involved not only the mechanical deployment but routing cables and establishing the R-F connection as well. (ARISS)

**

HAM RADIO IN SPACE: THAT ANNOYING SATELLITE IS OFF 2 METERS

An annoying mystery satellite transmitting AFSK, frequency modulated Morse on 144.100 MHz for several days has been identified. It turned out to be a signal from the MAROC-TUBSAT satellite. This is an Earth-sensing spacecraft owned by a Moroccan government agency called he Royal Center for Remote Sensing. It was placed into a polar orbit by a Russian launcher on December 10, 2001.

As soon as he learned of the interference to amateur operations, Professor Udo Renner of the Center had the 144.100 MHz transmitter turned off. He then notified AMSAT Germany that TUBSAT was no longer on two meters.

But TUBSAT also has a downlink at 436.075 MHz. This system is only busy over North Africa and Europe and only when the control stations in Rabat and Berlin are activated. It has not been heard elsewhere in the world. (AMSAT-NA)

**

Break 1

From the United States of America, we are the Amateur Radio Newsline, heard on bulletin stations around the world including the Pentucket Radio Club repeater serving Groveland Massachusetts

(5 sec pause here)

**

SPECTRUM PRESERVATION: ARRL SAYS IT WILL FIGHT TO KEEP RFID OFF 70 CM

The ARRL says that it will go all the way to protect the 70 centimeter ham band from a threat brought by commercial interests. At issue is a plan from SAVI Technology and already tentatively agreed to by the FCC to deploy unlicensed transient R-F identification tag transmitters operating between 425 and 435 MHz. These tags run at much higher field strengths and duty cycles than Part 15 rules now permit.

According to a League bulletin issued on January 29th, ARRL officials have already met with members of the FCC staff as part of the League's effort to stave off a band threat. The bulletin says that General Counsel Chris Imlay, W3KD, and ARRL Technical Relations Manager Paul Rinaldo, W4RI, delivered an ex parte presentation to FCC Office of Engineering and Technology staffers January 14th outlining the opposition of the ham radio community. (ARRL)

**

FCC: CHAIRMAN POWELL HOME AFTER HOSPITAL TESTS

Federal Communications Commission Chairman Michael Powell was discharged from the hospital on Friday January 25th. This, after a two-night stay in the to undergo tests because of a lingering stomach bug.

Stomach discomfort caused him to cancel appearances at the Consumer Electronics Show in Las Vegas on January 8th and again at the annual conference of the National Association of Television Program Executives on Wednesday January 23rd. Doctors advised precautionary tests that required overnight stays at Walter Reed Army Medical Center in suburban Washington. (Published news reports)

**

ENFORCEMENT: THAT SONG WAS NOT AS BAD AS WE THOUGHT

The Federal Communications Commission has dropped an indecency fine against a Colorado radio station. KKMG FM of Colorado Springs had been fined seven-thousand dollars for airing the edited version of Eminem's "The Real Slim Shady." This, after a listener wrote the regulatory agency to complain.

At the time the fine was issued federal regulators said the edited version still included some expletives and references to violence and graphic sex. But the FCC now says it has reconsidered. It now says that the lyrics in the edited version didn't violate its rules by being "patently offensive." (FCC)

**

RESCUE RADIO: BRAZIL RADIO OPERATORS HELP IN POWER OUTAGE CRISIS

A major electricity blackout hit at least five Brazilian states on January 21st, and it was hobby radio enthusiasts that let people know about it.

The blackout, which began at 1:30 p.m., hit hardest in the industrial southeast and the major cities of Sao Paulo, Belo Horizonte, Rio De Janeiro, Goiania, Vitoria and the capital, Brasilia.

According to news reports, Brazil’s National Energy Agency blamed the outage on transmission line failures. The same news report credited Brazilian hobby radio operators as informing authorities that subways in Rio De Janero and Sao Paulo were halted and that traffic lights were out snarling commuters in several areas.

The outage was caused by a failure at the Itaipu hydroelectric station in southwestern Brazil. A power-line failure caused thirteen of the dam's eighteen turbines to stop, cutting off nearly 20 percent of the country's energy. Power was restored about three hours later. The news story did not identify the radio operators as being hams. (Various shortwave news reports)

**

RESCUE RADIO: NEW INTER-JURISDICTION RADIO SYSTEMS BEING INTRODUCED

Santa Clara County California, police, fire and emergency medical personnel have never been able to communicate with one another at the scene of a major disaster. This is because each agency uses a separate radio system. That is expected to change this year.

Santa Clara County will be leading the nation in using new digital radio technology to solve the inter-agency communications problem. The new system will allow up to eighteen participating jurisdictions in any county to talk to one another instantly.

By way of example, once the system is up and running, officers involved in one of California’s famed high-speed car chase will be able to talk directly to police in the neighboring jurisdiction as the suspect approaches that town. They won't have to switch channels or go through dispatch centers. This means less time wasted and the probability that lives will be saved.

While Santa Clara county is at the head of the pack in adopting this new digital communications technology, the same news reports say that and Washington, D-C is not far behind. (Cal-State Info.)

**

PUBLIC RELATIONS: A CHEAP SATELLITE

A Cheap Satellite is the name of an Associated Press item that highlighted the work of the faculty and students at the United States Naval Academy in the development and launch of the P C Sat ham radio satellite. The story tells how the twenty-five pound bird was built using off the shelf products including a tape measure for its antenna and rechargeable double A cell batteries for power.

The story was written by Tom Stuckey and moved on the wire on Wednesday January 23rd. It noted that PCSat, was the 44th amateur satellite put in orbit. It is one of more than a dozen built by university students around the world. (VHF Reflector)

**

CONVENTIONS & HAMFESTS: ORLANDO HAMCATION WEAK SIGNAL FORUM

The Orlando HamCation will host its first ever Weak Signal VHF and UHF forum. Beginning at 2 p.m. on Saturday Ferbruary 9th, the one hour session will be moderated by N2CEI, of Down East Microwave. Also, Tom Haddon, K5VH, will be on hand to motivate more Florida hams to become active on the Microwave bands.

If you are in the Orlando Florida area on February 8th to the 10th drop in on the Orlando Hamcation. For more details and or advance reservations, go to oarc.org/hamcat.html on the World Wide Web (W2BZY)

**

CONVENTIONS & HAMFESTS: DATE CHANGE FOR RADIOFEST 2002

Brian Broggie, W6FVI, asks that we pass along a date change for RadioFest 2002 sponsored by the Naval Post Graduate School Amateur Radio Club in Monterey California. The new date is February 23rd. More information is in cyberspace at k6ly.org/radiofest. (W6FVI)

**

HAM RADIO SCHOLARSHIPS: THE DARA SCHOLARSHIPS

The Dayton Amateur Radio Association is one of three ham radio organizations seeking nominations for its scholarship program for the 2002-2003 academic year. According to DARA, applicants must be graduating high school seniors in 2002 and hold any class of an FCC issued mateur Radio license. The scholarship awards run up to $2000, as determined by the scholarship committee. Money must be used toward tuition at an institution of higher education.

To obtain an application, send a self-addressed, stamped envelope to the Dayton Amateur Radio Association Scholarship Program, 9873 Lower Valley Pike, Medway, Ohio 45341. You can also obtain an application by e-mail to n8emo1@msn.com. Completed applications must be postmarked no latter than June 1st to be eligible for this years scholarship program. (DARA)

**

HAM RADIO SCHOLARSHIPS: THE FOUNDATION FOR AMATEUR RADIO

Another organization offering scholarships to hams id the Foundation For Amateur Radio. The Washington, D.C. area group will administer sixty-two scholarships for the academic year running from 2002 through 2003. Licensed Radio Amateurs may compete for these awards if they plan to pursue a full-time course of studies beyond high school and are enrolled in or have been accepted for enrollment at an accredited university, college or technical school.
The awards range from $500 to $2500 with preference given in some cases to residents of specified geographical areas or the pursuit of certain study programs. Additional information and an application form may be requested by letter or QSL card to the FAR Scholarships, Post Office Box 831, Riverdale, Maryland, 20738. (Foundation For Amateur Radio)

**

INTERNATIONAL - SOUTH AFRICA: SA RADIO AMATEURS OF THE YEAR NAMED

Turning to international news, South Africa is honoring two of its own as that nations Radio Amateurs of the Year. Q-News Graham Kemp, VK4BB, brings us the details:

--
The South African Amateur Radio Development Trust have announced the winners of the 2001 Siemens Radio Amateur of the Year Award. This award is made annually to a Radio Amateur who has made a major contribution to the Amateur Service either on a technical or development basis in ZS land.

The award has been bestowed jointly on Bradley Phillips, ZS5BP, and Garth Wilson, ZR6CY. ZS5BP for his work on the introduction of Iphone and the development of the Internet Radio Linked project. ZR6CY for his continuous efforts to develop communication skills amongst the youth. He has to date presented no less than 80 camps for Voortrekkers to learn the Morse code and basic communication skills.

For Q-News Australia, I’m Graham Kemp, VK4BB, reporting for the Amateur Radio Newsline.

--

This award is considered as South Africa’s equivalent to the Dayton awards presented here in the United States. (SARL News, Q-News)

**

INTERNATIONAL - UK: KENWOOD TROPHY AWARDED TO G3XWH

Meantime, over in the U-K, Richard Horton, G3XWH, who chaired the RSGB’s Future Licensing and Examination Forum has been awarded the Kenwood Trophy. This, for his significant contribution to training and development in amateur radio.

Horton recently retired from the Radio Society of Great Britain’s Board where he was responsible for amateur radio development. His committee was responsible for much of the work that went into the creation of the new U-K Foundation Class license. (GB2RS)

**

DX

In DX, DJ4KW and DK9GG are currently active from Belize as V31YN and V31GW, respectively, through early February. Activity is on CW, RTTY and PSK 31. (RSGB)

And IN3QBR will be active from Vientiane as XW3QBR until the 31st of July. He will be joined, from the 20th of April until the 10th of May by IN3ZNR operating as XW3ZNR. (OPDX)

And R1ANF began operations as CE9 slash R1ANF on the 29th of December from a Chilean base in the South Shetland Islands. He is active on 10 to 28MHz with 100 watts to an R6000 vertical. For all three QSL as directed on the air. (RSGB)

**

THAT FINAL ITEM: CELEBRATING THE LIFE OF ED CLEGG W2LOY

And finally this week, if you were on the VHF bands in the 50's, 60's and 70's then the name Clegg Labs touched your ham radio operations. And as we hear in this report, the family of the man behind the gear is inviting you to help celebrate his life.

--

Even if you did not own any Clegg gear, the chances are that you talked to someone on the air who did. Whether it was the top of the line Interceptor receiver and Zeus transmitter or the entry level 99'er transceiver, it was easy to spot a Clegg signal by its almost overpowering modulation that seemed just right for the R-F carrier it was on.

Almost every product that carried the Clegg label was designed by the company's founder Edward T. Clegg, W2LOY. When he moved the company to Pennsylvania in the 1970's, Ed took the call W3LOY. Likewise, after retiring to Ohio he traded the 3 for an 8, but kept the famed L-O-Y suffix.

And regardless of the call area, Ed Clegg was first and foremost a communications designer well ahead of his time. Even more important, he was a positive influence on just about everyone with whom he came in contact.

Ed Clegg left us last September at age 80. Now, his wife Martie will be hosting a gathering in March near the Clegg home in Lancaster Ohio. The purpose is to celebrate the life of Edward T. Clegg. And they are asking you to help.

Martie, her daughter Linda and Linda's husband Rob MacGuffie, K2HZN, are asking anyone who knew Ed to share in the celebration. They know that most of you won't be able to be in Lancaster Ohio on March 30th. But some of you do have memories, stories, photos and other Ed Clegg memorabilia that would help to make this day even more unforgettable.

If you have something to share, please contact Linda and Rob before the end of February. Their address is 70 Province Road, Gilmanton New Hampshire with a zipcode of 03237. Rob's cyperspace address is K2HZN@yahooo.com.

For the Amateur Radio Newsline, I’m Cathy Anno, KB0FDU.

--

By the way, a number of us here at the Amateur Radio Newsline began our ham radio careers using gear designed by Ed Clegg. In fact, our producer Bill Pasternak, WA6ITF, got to know Ed while Bill was still a teenager operating A-M on the 6 meter band. (Clegg family)

**

NEWSCAST CLOSE

With thanks to Alan Labs, Amateur News Weekly, AMSAT, the ARRL, the CGC Communicator, CQ Magazine, the FCC, the Ohio Penn DX Bulletin, Radio Netherlands, Rain, the RSGB and Australia's Q-News, that's all from the Amateur Radio Newsline(tm). Our e-mail address is newsline @arnewsline.org. More information is available at Amateur Radio Newsline's(tm) only official website located at www.arnewsline.org. You can also write to us or support us at Amateur Radio Newsline(tm), P.O. Box 660937, Arcadia, California 91066.

For now, with Bill Pasternak, WA6ITF, at the editors desk, I'm ______________ saying welcome to the year 2002, 73, and we thank you for listening." Amateur Radio Newsline(tm) is Copyright 2002. All rights reserved.

Hello All,

I am in need of dip switch settings for the TAPR TNC2.

Any info most welcomed.

KC5NGX
John

One switch on, rest off to set baud rate of serial port.

1 -   300
2 - 1200
3 - 2400
4 - 4800
5 - 9600

The TNC will default to 7 bits, even parity, at least
with firmware up to version 1.6

Unless it has a 10 MHz clock, then the speeds
are doubled.

Ot has been hacked to run at an odd speed,
in which case it might do 1500 instead of 1200 baud
on the radio port, and similar ratio on the serial port..

(Yup, I've seen a couple like this ... they were cheap
because "they don't work".)

Hi all.

I have started the Hamradiolink reflector group for all those interested in
linking, or using their radio /pc's on the internet. Using software's like
the M0ZPD or ilink, etc.

http://groups.yahoo.com/group/hamradiolink

Hit the button and join in :-).

Best Regards,

Dave G3VFP

Hi,

Just acquired a M-7000 decoder that needs restoring, interested in hearing from other users as to the capabilities of the unit, problems experienced. Have a manual and have done a Web search - but not a lot wiser. Normal decoder here is the PK232.

TIA,
--

In regard to Question 2, I using an upgraded PK-232MBX with the DSP and PSK boards. Runs nicely with PKTerm99. PKTerm99 includes a waterall display and switch between the soundcard and the TNC. In case you don't want to use PKTerm99, Timewave provides a neat little utility named ModemSwitch with the PSK board that allows you to run any program you want with the soundcard or TNC.

In PSK31 mode the sound card and computer are doing the work. The
PK232 is simply passing audio tones between the radio and the sound
card. With the PTC-II, it is the PTC-II that is doing the PSK31
encoding/decoding and simply sending ASCII text between the computer
and the PTC-II (which is why the software doesn't have a waterfall).
You could easily build a switch to swap audio connections between the
PTC-II and the sound card and use the sound card for PSK31 and the
PTC-II for everything else - just like the PK-232.

Wow, I used that when my daughter was born. She's
23 now and just got her MBA, now she's off to Med
School in PA.

Actually JNOS was better, because the TNOS author
went away after his car accident. "Better" because
it was under active development and debugging.

The "Aladdin's Cave" of Linux amateur radio software is at:

http://radio.linux.org.au

The initial page is the newest stuff - dig deeper through
the menus for 'packet' software.

Check out especially: 'node', 'awznode' and 'xnet'.

With Linux, you don't need to run a front end node for BBS access on a multiport system, but the locals expect it !

73,

Gareth.

I recently aguired a IC720A, and I do not have a manual for it. Des anybody have a used users/service manual they could part with? Or what I more urgently need is the microphone and accessary jack wiring details so I can wire in a Mic. and PSK-31.

Thanks
Tom

Yes, but unfortunately the ModemSwitch software links to the standard IRQs, not to the actual device name. My COM1 and COM2 both happen to be on IRQ11, courtesy of my multi-function board. Although I tell ModemSwitch to talk on COM1 it insists that it wants COM4/IRQ2 which is a timer on the system board. I have no such problem with the PC PakRatt for Windows software, nor with old PKTerm98. I'm now looking at putting a manual switch on the front panel to drive the switchover relay.

For the one saying "* for auto....", press "*" a few times. What it is trying to do is autodetect the serial port baud rate. Once that is done, you'll be in command mode, which is where the other PK-88 appears to already be.

Karl,

It's more than just a hardware switch.. it needs software commands to change it in and out.

You do know the upgraded Pkterm for Windows will switch the sound card in and out without modemswitch and let you do PSK-31 from directly inside Pkterm.

Also, if the creators of other modes will provide us with either DLL or C++ class libs with engines for their protocols, we'll add them in. This would mean MT16, MFSK, SSTV, RTTY or any other mode that the freeware programs provide. These modes would be fully available in demo mode, without the capability of switching in and out the sound board, and full switching after purchasing the program.

The upgrade to 1.5.4 if you purchase Pkterm before May 15, 2001 is $29.95, upgrade from PakRatt is $49.95 and full version is $79.95. And you get full support of both CSS and Timewave for the products.

Rick - W4PC
http://www.cssincorp.com/pkterm

"Karl Beckman" <Karl.Beckman@Motorola.com> wrote in message news:a24ile$ko5$1@newshost.mot.com...

> Yes, but unfortunately the ModemSwitch software links to the standard IRQs, not to the actual device name. My COM1 and COM2 both happen to be on IRQ11, courtesy of my multi-function board. Although I tell ModemSwitch to talk on COM1 it insists that it wants COM4/IRQ2 which is a timer on the system board. I have no such problem with the PC PakRatt for Windows software, nor with old PKTerm98. I'm now looking at putting a manual switch on the front panel to drive the switchover relay.

rec.radio.amateur.digital.misc:4040 uk.radio.amateur:45793

This is a request for comment on technical proposals for a new device to interface a PC to a radio for medium (later high speed) digital communication.

Items to consider are:
1. Compatability with existing systems
2. Operating System independant solution
3. Multiple interfaces (Intel propose to "phase out" serial ports in the
� �next 12 months)
4. Expandability beyond a single 'port'
5. Low cost
6. Capable of home construction (avoidance of very large surface mount
� �devices)
7. Open design

Terms:
PC - Personal Computer - includes IBM compatible PCs, Macs, Suns or any other desktop computer normally considered to have sufficient processing capability to provide more than just a dumb terminal interface.

1. Compatability with existing systems

It is plain that the packet system within the UK is becoming fragmented so it is now sometimes impossible to directly connect using the AX25 protocol to a BBS requiring sometimes several hops or digipeats via nodes or other users.

To this end, it is envisaged that connected mode AX25 will not be supported in the interface device. There are advantages in the use of AX25 in disconnected mode as the point-to-point link layer protocol to remain compatability with existing systems. The use of connected mode is for further study.

2. Native support for a wide range of Operating Systems

One of the current difficulties with closed source Operating Systems is the expense of creating the necessary device drivers and software interfaces for viable operation. Support for the few projects that are available for these closed systems is usually dependant on a single author which often leads to even very good and widely used systems being dropped due to pressure of work, ill health or loss of interest.

It is proposed that ALL systems be considered closed for the purposes of the design of this interface so that it makes no assumptions about the availability of software interfaces hosted within the PC or at the very least only makes use of well documented interfaces and protocols (e.g. SLIP, PLIP, PPP etc).

3. Multiple interfaces

The lifetime of an IBM compatible PC can be considered to be about 10 years before no supported software is available to run on it (try going to a shop and buying a copy of DOS!). Over this timeframe, many different interfaces have come (and gone) so the design should be flexible enough to allow either direct connection to several of them or be expandable to connect new and different interfaces to it.

Thought should in particular be given to those interfaces likely to disappear from new PCs in the near future, such as floppy and serial.

The minimal set for the primary design is serial and USB but parallel, ethernet, IDE and SCSI should also be considered.

The building blocks of the interface should use a means of communication at as high a speed as possible to maintain this flexibility.

4. Expandability beyond a single 'port'

At some point, a user is likely to want to either operate on more that one frequency or at more than one speed at once. Current TNC designs are generally either fixed as a single port or internal PC cards that are expensive to start with but do allow expansion with additional modems. The creation and expansion of a digital network also requires that some individuals make a considerable investment in multiple port user access and backbone 'linking'.

Most physical interfaces on a PC generally only allow a single device to be connected so thought must be given to means of multiplexing to additional ports.

5. Low cost

As well as individual parts costs, the assembly costs (in time and use of dedicated equipment) should be considered. Surface mount is OK for home construction in low pin count packages but becomes a problem when devices with upwards of 200 pins are specified. The choice of parts also reflects in the cost of PCB design and manufacture.

6. Capable of home construction

As with the previous point, no special tools should be required to construct the interface (e.g. flow/wave soldering). This does not preclude the possibility that certain skills are required (i.e. fixing low pin count SMD).

7. Open design

The design and implementation should be progressed under the GPL license so that it not dependant on any single person or group of people. The take-up of a new design is most likely if the designs, protocols, hardware, firmware and software are all readily available.

This does not mean that it is free - just as TVIPUG charges a small premium for its 9k6 modem kits - the designs are available to be duplicated/improved by others.

Is there no KISS in the standard firmware?

I would not run a node with KISS TNC's anyway, but that is another issue.

Here's another interesting perl program I wrote. This one takes received messages from the LinPac storage folder and transfers them to your e-mail address. It's not ready to be used as a full service gateway yet, but for single user, local use, it works!

```
# Source code begin

#! /usr/bin/perl
#
# LinPacFWD
# Version: 0.1-a
# Mario Melendez, TI2DLL (mmelendez@engineer.com)
#
# LinPacFWD is a program complementary to LinPacGW, which does the opposite:
# it takes a packet message from the LinPac storage folder, chews on it for
# a while and then sends it via e-mail to the address you specify.
# LinPacFWD takes input from stdin, which means you need to pipe your
# message to it, for example using cat 1000 | linpac.fwd
#
# LinPacFWD isn't destined to be a full service gateway... yet. It's mainly
# designed for a single user that's got LinPacGW installed and wants to
# read his packet messages using his unix mail client instead of LinPac.
#
# Installation: put LinPacFWD in your favorite directory. Then take the
# messages from your LinPac incoming folder and pipe them to the program.
# On my machine I have a cron job that cat's the messages and pipes them,
# which seems to work nicely. LinPacFWD is smart enough so as not to send
# you the same message twice on a particular BBS.
#
# CONFIGURATION:
#
# $mailto - E-mail address to send the messages to
# $from - Address which will appear on sent messages
# $indexfile - File where record of sent messages is kept.
```

```
#
# NOTE: LinPacFWD requires the Mail::Sendmail module be installed in
# your version of PERL (this sendmail isn't the same thing as the
# sendmail MTA). The module is available from www.cpan.org.

$mailto="me\@myserver.net";
$from="packet\@mygateway.net";
$indexfile="/home/me/.linpacindex";

use Mail::Sendmail;

while (<>) {
     push @content, $_ }

# What's the message number?

(undef,undef,$msgnum)=split(/\s/,@content[0]);
(undef,$msgnum)=split(/#:/,$msgnum);

# See if the message has been processed before

$process=1;

open FILE,$indexfile;
while (<FILE>) {
     $process=0 if $msgnum==$_;
     }
close FILE;

if ($process==1) {

# Strip initial route lines

@content=reverse(@content);

$a=0;

foreach(@content) {
     if (m/^R:/) { splice (@content,$a) }
     $a++; }

@content=reverse(@content);

# Now send it via e-mail

%mail = ( To => $mailto, From => $from, Subject => "[Packet] Message $msgnum");
$message=join("",@content);
$mail{"Message : "}=$message;

if (sendmail %mail) { $ok=1; }
else { print $Mail::Sendmail::error; }

# Add the message number to the processed list
open FILE,">>$indexfile";
print FILE "$msgnum\n";
close FILE;

} # if

# Source code end
```

Here's a little something I wrote in my spare time. Thing is, I've been trying to set up my packet system on Linux for a while now, and what's limited me so far is the software available. The most I've found is LinPac, who's mail functions tend to be a little buggy. But the message transport routines in LinPac work nicely, so I figured I could use those and pipe the messages to my regular e-mail reader (mutt) and work from there.

What LinPacGW does is take an e-mail message, process it, and add it to the end of the LinPac outgoing queue. Then when you run LinPac with a :forward command your messages get sent to your BBS. Installation is pretty simple: add an alias to your system pointing to the program, then send your messages there. On the first line you should specify TO:<address> if you want to send to a particular packet recipient, and if you want a personal message, add [P] to the subject (with the square brackets).

Comments are welcome.

```
# Begin source code

#! /usr/bin/perl
#
# LinPacGW
#
# Version: 1.0
# Mario Melendez, TI2DLL (mmelendez@engineer.com)
# January 16, 2001
# Provided "as is"... use at your own risk.
#
# LinPacGW is a PERL script which takes a message fro your e-mail
# MTA and adds it to the outgoing LinPac queue.
#
# So far it's been tested successfully using LinPac 0.16pre9 under
# Debian 2.1 and PERL 5.005_03
#
# Installation: put the program in your favorite directory and create
# an entry in /etc/aliases which will pipe the messages to the program.
# If you're using exim as your MTA, you'll probably need to uncomment
# the "user = list" in the system_aliases part of your exim.conf file.
#
# Use: send your e-mail messages to the aliase you created. If you want
# to send a personal message, include [P] (with the brackets) in the
# subject. If you want to send to an address different from the default one,
# add TO:<address> (without the brackets) to the first message line.

# CONFIGURATION

# Before using the program, set the following parameters, as well as
# the necessary rwx permissions on your LinPac directories.
#
# maildir - Directory where LinPac stores its outgoing messages
# msglist - Complete path and filename of the messages.local file
# gateaddr - Gateway address, which is the address which will be used
#            for the From: part of the outgoing packet messages.
# defto - TO: address which will be used if none is specified.
# gmthours - Hours to add/subtract for GMT time.
# dflag - Default message type. BO = bulletin. PO = private.
#         Don't forget the O at the end or LinPac won't process it.
# gwid - Gateway ID line, which is appended to the message.

$maildir="/root/LinPac/mail";
$msglist="/root/LinPac/mail/messages.local";
$gateaddr="GATEWAY\@MYBBS.MYD.MYO";
$defto="TODOS\@WW";
$gmthours=6;

Anyone have any opinion on the MFJ-1275 vs. the Rigblaster, as a soundcard-to-radio interface for HF PSK31?

I installed Digipan and a few other sound card programs for PSK31, RTTY, MT63, etc., and everything worked fine. Then I installed an STB TV tuner card and Hauppauge WinTV program, which also works fine ... except that now all of my digital comm programs (Digipan and the others) are broken ... they can't access the sound card.

I uninstalled all of the digital-mode programs I had installed, and re-installed Digipan, but no luck.

I haven't yet tried uninstalling the TV tuner and removing the card. Before I do that, I wanted to check in here and ask ... Has anyone else tried using this combination or anything like it, and have you had the same problems and found solutions?

Thanks...

Rick WA1RKT

Check the Device Mangler to be sure you don't have an IRQ conflict, or worse yet, Windoze hasn't decided to move the sound card to somewhere that Digipan can't find it. Windoze does these things for you.

You might also try moving the Hauppague IRQ somewhere else. I have a little older version of DigiPan so it may be fixed by now, but I noticed that DigiPan puts it's keys in a nonstandard place in the registry. If DigiPan remembered the sound card location in the registry you might have a hard time finding it, and there is no guarantee that the uninstall took care of the key, especially since it isn't in the normal place and the commercial install/uninstalls are unlikely to find it.

I have a mfj1275 I think it suck!!!! I have been thru 4 unit before I could
get one to work with the Icom 706. I have tried various shareware programs
and even bought the mfj1296 multimode software frome mfj and it still suck.
I would be using it on MARS freq for digital mode. I heard from Rigblaster
that they have about 7000 unit out and mfj only have about 500.

I don't use either here but the RigBlaster looks really good on their web site and I've heard lots of good reports about it. If you're going to do a voice contest keyer or slow scan, it really shines. Your mic is normally switched to the rig for either PTT or VOX use. When your software keys the RigBlaster, it shuts off the mike and switches the audio to the sound card. Makes it real easy to go between voice and the sound card. I think most of the others are designed with only the digital modes in mind whereas RigBlaster has considered the voice/sound card switchover.

KISS ON
RESTART

Of course the problem with using the standard Tiny-2 firmware is that if
the TNCs reset for any reason, they're no longer in KISS mode.

G8BPQ's JKISS works well in Tiny-2s, or in any other TNC-2 clone.

Hi!

I want to take my HamRadio Equipment to my holiday. And I want to use Pactor
and PSK31. But I've only a small pentium 100 laptop with 32 MB RAM and no(!)
Soundcard.
Is there a (cheap) hardware (may be homebrew or kit) solution for an
external decoder putting the decoded signals into the RS232 of my Laptop -
like a modem?

Thank you!

Andreas Weller [DF1PAW]

Based upon the keyword "cheap" - not that I know of. I think the SCS PTC-II series is the only one that can do PSK31 without a sound card and it's not "cheap" by my standards :-0

The new Kantronics KAM XL can do PSK-31 and Pactor without the sound card. It's on $399.00. And of course Pacterm for Windows will run on a 486 or better with the KAM XL. Pacterm for Windows lets you use point and click "Zoom/Tune" for tuning the PSK-31 signal with the XL. It is less expensive than the PTC-II series and both a very good TNCs.

Is there anywhere on the web I could go and find good software for LINUX/TNC use.

Also, I have a linux(debian) box that I have set up with ax25 kernel. It looks like im creating the devices ok, but I cannot connect anywhere? it also gives me a rose port not active when trying to use node..

AMATEUR RADIO NEWSLINE(tm) REPORT #1275 - January 18 2002

Amateur Radio Newsline report number 1275 with a release date of Friday, January 18th 2002 to follow in 5-4-3-2-1.

The following is a Q-S-T. A new ham antenna on the I-S-S and a new microwave record down-under are first on Amateur Radio Newsline report number 1275 coming your way right now!

(Billboard Cart Here)

**

HAM RADIO IN SPACE: NEW ANTENNAS INSTALLED ON THE ISS

An American astronaut and a Russian cosmonaut ventured into space on Monday January 14th to move a construction crane and install a new set of ham radio antennas on the International Space Station. Roy Neal, K6DUE, has the details.

--

THERE IT WAS, ON NASA TELEVISION, TWO WHITE SPACE SUITED CHARACTERS, DWARFED BY THE IMMENSITY OF THE INTERNATIONAL SPACE STATION. FOR THE 32ND TIME ASTRONAUTS AND COSMONAUTS WERE OUTSIDE THE HUGE SPACECRAFT TO ASSEMBLE HARDWARE.

THEIR PRIMARY OBJECTIVE WAS TO MOVE A BIG CARGO CRANE FROM ITS TEMPORARY BERTH ON THE UNITED STATES SIDE OF THE ORBITING OUTPOST TO A PERMANENT LOCATION OUTSIDE THE DOCKING COMPARTMENT OF THE RUSSIAN CONTROL MODULE.

THAT ACCOMPLISHED, THEY WENT ON TO UNFURL A HAM RADIO ANTENNA. ASTRONAUT CARL WALTZ, KC5TIE AND COSMONAUT YURI ONUFRIENKO, RK3DUO, DEPLOYED THE RIBBON OF TAPE THAT SOON WILL BE IN USE ON A HAM RADIO STATION IN THE SERVICE MODULE,. WHERE THE CREWS LIVE AND SLEEP. A SECOND STATION HAS BEEN IN SERVICE FOR SOME TIME INSIDE THE SO CALLED FUNCTIONAL CARGO BLOCK, ANOTHER SECTION OF THE I S S.

FRANK BAUER, KA3HDO, THE CHAIRMAN OF ARISS, THE GROUP THAT IS RESPONSIBLE FOR AMATEUR RADIO ON THE SPACE STATION, CONGRATULATED THE INTERNATIONAL TEAM OF LICENSED HAMS FOR THE SUCCESSFUL CONCLUSION TO MONTHS OF HARD WORK.

ON JANUARY 25th ONUFRIENKO IS SCHEDULED TO GO OUTSIDE AGAIN, WITH FLIGHT ENGINEER DAN BURSCH, KD5PNU, TO INSTALL 3 MORE HAM RADIO ANTENNAS OUTSIDE THE MODULE THEY CALL ZVEZDA, THE CREW COMPARTMENT THAT’S THE SIZE OF A PASSENGER BUS HERE ON EARTH.

HAM RADIO IS GROWING RAPIDLY IN SPACE, ALONG WITH THE INTERNATIONAL STATION ON WHICH IT’S INSTALLED.

FOR THE AMATEUR RADIO NEWSLINE, ROY NEAL, K6DUE

--

The Expedition 4 crew will remain on board the ISS until May. And according to Frank Bauer, KA3HDO, another important task is to bring the automatic packet system back on line. He says that ground technicians are working with the astronauts and cosmonaut on that project and that task will continue as crew time permits. (ARNewsline from information provided by ARISS, NASA.)

**

HAM RADIO RECORDS: 24 GHZ DOWN-UNDER

A new distance record is set on a band where even commercial interests are only now starting to tread. And its a group of Australian hams who have set it. Q-News Graham Kemp, VK4BB, has the details:

--

A new Queensland distance record on 24.048.1 GHz USB was established morning of Tuesday 08 January over a 72.8 Km path. Location 1 was at Wellington Point, with VK3ZQB and VK4ZHL portable. Location 2 was at Caloundra, with VK3XPD and VK5DK portable operating.

Signals strengths up to 5x5 after initial optimization with typical daytime QSB. The visiting team are continuing with local propagation experiments. The challenges of building and operating microwave amateur radio equipment are wonderfully rewarding in many ways!

From Q-News Australia, I’m Graham Kemp, VK4BB, for the Amateur Radio Newsline.

--

Further experimentation is expected to bring even more record setting contacts in this very microwave ham radio band. (Q-News)

**

RESTRUCTURING: BIG LICENSING SUCCESS IN THE UK

A new slow-code license recently introduced in the United Kingdom is also setting records. This in the area of people flocking to get it. Jeramy Boot, G4NJH, days that the new British Foundation License is on its way to becoming a major success:

--

The Radio Licensing Center reports that, as of the 7th of January, exactly 600 of the new M3 Foundation Licenses had been issued.

In the 'QSO Party' for Foundation Licensees that took place on the 1st of January it is estimated that about 100 M3 stations were active. Many joined the one-minute-past-midnight 80-meter net and many more were heard working DX during the subsequent days.

One person active on the 1st of January was Mike Marsden, M3BQH, who also holds the callsign G8BQH. Mike reports that he worked Alex, UR5EDU, in the Ukraine at two seconds past midnight, using 10 watts on 40 meters. The report was 59+10dB. After a few hours' sleep M3BQH worked 66 stations on the first day, with only two short CQ calls.

"The pile-up queue was never ending, I even managed to work seven other M3s", Mike said.

Jeramy Boot, G4NJH

--

To put this in perspective. The UK has 57,814 hams so 600 is about 1%. Here in the United States we have close to 625,000 licensees. That's the equivalent of getting 6250 hams signing up for a new license class here in the USA in only a few short days. (GB2RS)

**

BREAK 1

This is ham radio news coming to you from the United States of America. We are the Amateur Radio Newsline, including the W8GK repeater serving Charleston West Virginia.

(5 Sec Pause Here)

**

RADIO REGULATIONS: FCC'S APPROVES DRAFT WRC PROPOSALS

The FCC's Advisory Committee for the year 2003 World Radiocommunications Conference has approved its preliminary draft proposals. The document has been assigned as D-A-02-101 and deals mainly with satellite and terrestrial allocations in the UHF and microwave bands. Amateur Radio is only briefly mentioned in the area of 890 to 1350 MHz allocations.

The Advisory Committee itself was formed in January of 2001 to assist in the development of United States proposals for WRC 2003. DA-02-101 is based primarily on the committee report. Comments on it are due on it no later than January 28th.

The complete of 55 page text of DA-02-101 is on the FCC website at http://hraunfoss.fcc.gov/edocs_public/attachmatch/DA-02-101A1.txt (FCC)

**

ENFORCEMENT: CLEAN UP THE INTERFERENCE - PLEASE

The FCC has written to an A-M radio station and an electric power provider to help resolve an unusual and long-standing interference situation. One affecting local amateurs in the Cincinnati and Mason Ohio areas. Amateur Radio Newsline's Don Wilbanks, KC5MFA, brings us up to date:

--

The letter suggests that multiple sources may be involved in this interference case. Also that two that are possibilities are Cinergy Corporation and radio station WLW. Cinergy is the electric company to the affected area and WLW is a Clear Channel Communications owned power-house AM station serving the greater Cincinnati area from a transmitter in Mason.

WLW operates on 700 kHz with 50,000 Watts into a single element diamond shaped half-wave vertical tower. This is only one of two such towers left in the United States, the other belonging to WSM AM in Nashville Tennessee. Both were constructed in the early 1930's by the now defunct Blaw Knox Construction

Corporation.

One of the amateurs affected is Bob Reiff, WA8ULW, of Mason. Reiff told the ARRL Letter that while the noise is most noticeable on 160 meters, it's showing up elsewhere. He says that some local hams suspect it is even causing problems even on a two meter repeater.

In its letters, the Commission says that it recognizes this to be an unusual case. It says that the source of the interference could turn out to be something else unexpected. But the Commission adds that it is turning to the radio station and electric utility company and asking for their help in finding the source of the noise plaguing the Mason ham community. It's also asking that both cooperate with the technical experts from the American Radio Relay League in solving the problem.

For the Amateur Radio Newsline, I'm Don Wilbanks, KC5MFA.

--

By the way, More information on this very interesting Blaw Knox diamond tower design and the ones installed at both WLW and WSM is available on-line. Simply take your browser to http://www.wsmonline.com/w_homepage/tower/index.html. Its very interesting reading. (FCC, ARRL, Amateur News Weekly)

**

ENFORCEMENT: UNLICENSED OPERATOR TOLD TO EXPLAIN

A former ham that the FCC says may have been on the air without a license has been asked by the agency to provide an explanation. The person posing the questions is FCC chief ham radio rules enforcer Riley Hollingsworth, K4ZDH. And in a recent Rain Enforcement log, Hollingsworth outlined the situation:

--

Hollingsworth: "We requested clarifying information from Brian Bailey, ex-KD5PXQ. His license was set aside by the Wireless Bureau on October 19th. We want to know his exact whereabouts on two specific days in September. Bailey has been in touch with us and is deciding weather to provide the information."

--

According to Hollingsworth, the information that the FCC wants from Bailey relates to allegations of unlicensed operations and malicious interference. (FCC, RAIN)

**

HELPING HAMS: HAMDIHAMS NEW E-MAIL ADDRESS

This note: The Courage HandiHam System has a new electronic mail address. You can now reach the group at handiham@courage.org. You may also contact its Director Pat Tice directly at wa0tda@arrl.net. (HandiHams)

**

CONVENTIONS: HAMVENTION SAYS BRING YOUR BUS AND LAVE THE PARKING SPOT TO US

Free parking at the HARA Arena for Hamvention? Well, kind of. Its free if you leave your car at home and charter a bus to bring in a pretty large group of people to the event. Amateur News Weekly's Phil Thomas, W8RMJ has the not so complex details:

--

For Amateurs who charter a bust to make the annual journey to Hamvention, the Dayton Hamvention Committee will reserve a parking place for your chartered bus for the entire three days of Hamvention. The reserved parking will be close to the HARA Arena Complex, allowing not only a place to secure your valued purchases, but also a place to rest those weary feet after walking many, many miles of Hamvention. Space is limited for the new charter bus parking area. Pre registration is required. Availability is on a first come, first served basis.

--

For more information on the new on-site charter bus parking offer or to reserve a space, please contact the Dayton Hamvention office. It's open normal business hours Eastern Standard Time at are code (937) 276-6930. You can also fax your request toll free at
1-800-491-4267.   (Amateur News Weekly)

**

CONFERENCES: SE VHF SOCIETY IN APRIL

Greg Robinson KB4NVD says over the VHF Reflector that the Sixth Annual Southeastern VHF Society Conference will take place April 26th through the 27 Th. in Oak Ridge, Tennessee. The conference, hosted by the Southeastern VHF Society, promises to be an interesting and exciting event with presentations from accomplished VHF and up amateur radio enthusiasts from several parts of the country. Registration, program details, hotel and travel information can be found in cyberspace at www.svhfs.org. (SE VHF Society)

**

HAM RADIO EVENTS: KIDS DAY A BIG MID-WEST SUCCESS

The first Kids Day operating event for 2002 was a rousing success in many venues. But in one Mid-West city a bit of coverage on a local T-V station helped to make it even better. Again to Amateur News Weekly and reporter Jack Parker, W8ISH:

--

Kids Day at the Indianapolis Chapter of the American Red Cross got a boost when event coordinator Stece Wendt, KB9RDS, made an appearance on a local TV news program. During the two minute segment. Wendt told viewers that all kids and their parents were welcome to share in the Amateur Radio experience, including an introduction to Morse Code, VHF repeaters and HF:

--

Wendt: “And then we turn around tand take them over to the big radios -- the big base station radios where they can talk -- literally -- around the world.”

--

This is the second year the local Red Cross chapter has shown young people how to tune in the world.

Reporting from Indianapolis Indians for Amateur News Weekly, This is Jack Parker, W8ISH.

--

This is just one of many Kids Day success stories. We will have more in future Amateur Radio Newsline reports. (Amateur News Weekly)

**

BREAK 2

(5 sec pause here)

**

ARNEWSLINE(tm) FINANCIAL UPDATE WITH N6TCQ

It’s time for a report on the financial situation here at Amateur Radio Newsline. With it is our Support Fund Administrator and Corporate Treasurer, Andy Jarema, N6TCQ:

--

It is January of 2002. A brand new year for ham radio. And the beginning of another year for us here at the Amateur Radio Newsline. And as we start off the new year, here are the current finances.

Looking in the new corporate checkbook, the balance shows us at about $700 give or take a few bucks. Not very much when you consider that it takes over a thousand dollars a month to produce these weekly 20 minute Q-S-T’s.

Obviously, Amateur Radio Newsline is going to need your help -- and -- need it quickly to keep it from going away and to keep the news of ham radio coming your way.

We have done all that is possible from our side to keep costs under control. But, some fixed expenses like the telephone and long distance calling are a must have. So are electronic mail and world wide web access. There is the cost of the routine maintenance on the tape machines and editing gear. And in a few months the Newsline sponsored Young Ham of the Year Award will be rolling our way. All of this adds up and some costs just keep going up. When you add it all up and average it out, it comes to that $1000 a month figure I just mentioned.

So now is the time when Amateur Radio Newsline has to ask to ask that you help to keep its newscasts coming your way. Your tax deductible contributions can be sent to the Newsline Support Fund, Post Office Box 660937, Arcadia California. The Zipcode is 91066.

Ill be back within the next few weeks with an update on how things are going. For now from the Amateur Radio Newsline support center, I’m Andy Jarema, N6-Tiny-California-Quake.

--

Don’t worry if you missed the address. It will be repeated in a few minutes at the end of this weeks newscast. (ARNewsline(tm) Support Fund)

**

ARNEWSLINE(tm): WE ARE GOING MP3

One other piece of news concerning Amateur Radio Newsline. As of March 1st, we will be dropping Real Audio and going exclusively MP3. Why the change? Well ever since we began posting a downloadable MP3 file at our own FTP site along side the Real Audio file, 9 out of 10 people have chosen the MP3. And with good reason. MP3 simply sounds a lot better than Real Audio to most of you. And by dropping the Real Audio, we can make the MP3 sound even better by encoding at a higher bit rate.

Right now, you can still compare the two formats if you like. Until February 22nd we will continue to post both Real Audio and MP3. Take the time to download both. And don’t worry. Most modern media players including Real Audio, Microsoft Media and Winamp play MP3 so the chances are that you are already equipped to cover of the digital format change. (ARNewsline(tm))

**

SCIENCE AND TECHNOLOGY: THE NOISE OF EARTH

According to Space Daily, researchers have known for three decades that the Earth is a potent radio transmitter, but they were never able to pinpoint where the noise was coming from. Recently, by using data from the four spacecraft of the European Space Agency's Cluster mission, NASA-funded scientists have precisely located the source of the radio noise along the magnetic field lines. The noise originates several thousand miles above bright regions in the Earth's
northern lights. (AMSAT, Space Daily)

**

INTERNATIONAL-CANADA: ARE AGREEMENT IN B.C.

Turning to international news, Radio Amateurs of Canada which sponsors that nation’s Amateur Radio Emergency Service has signed a Letter Of Understanding and the British Columbia Provincial Emergency Radio Communication Service. The letter represents the collaboration between Radio Amateurs of Canada’s British Columbia Section Manager Fred Orsetti VE7IO and Supervisor of Information and Communications Technology for the Provincial Emergency Program Andrew Bryan VE7KSN, to provide a cooperative plan to carry out emergency communication. The letter also further enhances the work of the Canadian ARES program and compliments the Memorandum of Understanding signed May of 1994 between Radio Amateurs of Canada and Red Cross. (RAC)

**

INTERNATIONAL - CANADA: VE1AWA RESIGNS AS MARITIME PROVENCES SM

Due to personal reason Roy MacIntosh, VE1AWA has stepped down from the position of Section Manager for the Maritimes. Tom Caithness, VE1GTC has been appointed acting Section Manager pending outcome of the upcoming election call. (RAC)

**

INTERNATIONAL - UK: AMSAT-UK COLLOQUIUM

The 17th AMSAT-UK Colloquium will be held at Surrey University in Guildford from the 26th to 28th of July this year. AMSAT-UK is now inviting speakers to submit papers about amateur radio space and associated activities for this event and for the Proceedings document. Offers of papers should be submitted as soon as possible and should be sent only to Richard Limebear, G3RWL. His e-mail goes to g3rwl@amsat.org. (AMSAT-UK)

**

HAM RADIO IN SPACE: WEBSITE UPDATE

AMSAT reports that IK8XLD has updated his website with information about satellite operations, EME, the ham radio operation on the International Space Station, ATV and homebrew equipment. You can visit Rocco’s website at www.qsl.net/ik8xld. (ANS)

**

DX

In DX, DJ4KW and DK9GG are active from Belize as V31YN and V31GW respectively until about the 2nd of February. Activity is on CW, RTTY and PSK 31. (GB2RS)

And KE1F will be active on 10 to 160 meters CW, SSB and perhaps RTTY as ZF2LM from Grand Cayman Island from the 14th to 30th of January. (GB2RS)

Also R1ANF began operations as CE9 slash R1ANF on the 29th of December from a Chilean base in the South Shetland Islands. He is active on 10 to 28 MHz with 100 watts to an R6000 vertical. For all three, QSL as directed on the air. (OPDX)

Last but by no means least, word that JX7DFA, is on a job assignment to Jan Mayen. He is operating as LA7DFA. QSL via his home call. He will reply when he returns home in the Spring. (Modern DX)

**

THAT FINAL ITEM: A CALL FOR ARDF HUNTERS FOR THE WORLD GAMES

And finally this week, 2002 may be the biggest year yet for fans of hidden transmitter hunts, especially the ones that are all on foot. Amateur Radio Newsline’s Joe Moell K0OV helps coordinate happenings like these and has news of two major events.
--

Every two years, hams from around the world gather to see who is best at on-foot hidden transmitter hunting, also called foxtailing, radio-orienteering and ARDF. There are separate events on eighty meters and two meters, each with five transmitters scattered in a forest that can encompass 1000 acres or more.

Competitors are divided into five categories for males and four categories for females. Each country may have up to three persons per category on its team.

Back in Y2K, the championships were in China, with a dozen stateside hams among the competitors from 26 countries. This year, the excitement moves to Slovakia and takes place from September 2 through 7. Once again, ARDF Team USA will be there.

Would you like to be on that team? If so, contact me right away, because USA must submit its Letter of Intent to the Slovakian hosts by the end of January.

Of course you'll need lots of practice beforehand, and you can get plenty by attending USA's own national ARDF championships, which will be April 19-21 in Pine Mountain, Georgia, near Atlanta.

Find out about both championships -- Slovakia and Pine Mountain -- by visiting my Web site: www.homingin.com. Homingin is one word. Then apply for the Team USA roster at my e-mail address on that site, or by postal mail to my callbook address.

Maybe you'll bring home a medal this year. From southern California, where this year's local radio-orienteering training sessions will begin soon, this is Joe Moell K-zero-Oscar-Victor for Amateur Radio Newsline.

--

In case you missed it, Joe’s website is www.homingin.com. “homeingin” is one word. (K0OV, ARNewsline(tm))

With todays PCs a separate standalone device is no longer required nor is it very cost-effective. A plugin card has the advantage of low cost and tight control by the software.

Look here for a modern card:
http://www.baycom.org/bayweb/tech/pciscc/pciindex.htm

When you really want a standalone device, interface it using ethernet and use standard protcols like TCP/IP. The device can be a plain IP router and will work with all existing operating systems, and for connected mode AX.25 it can be a telnet server and interpret a TNC-like command set for use by existing software (either with small mods to use a TCP session instead of a COM port, or a small resident driver that connects a COM port to a TCP session).

Existing design that can do this: TNC4e

I think it really is too late to start developing a new device from scratch. Packet radio is mostly gone and will not return. What packet radio users call "high speed" is called "slow" by wireless LAN standards.

It seems better to use one of the existing developments (mostly from Germany) when you want to experiment with high speeds, or help to finalize the development of an existing design.

Rob

Hi,

Forgive my dumb question, but I was reading about how to set up an APRS path to the setting "VIA NOCALL" and my Kenwood TM-D700 will not allow me to use the SPACE character within the path field of the APRS configurations (as far as I can tell). So my question is how do I enter this into the path?

My best guess is: "VIA-NOCALL" or "VIA,NOCALL" or "NOCALL" (without the VIA).

Does somebody know the way I'm supposed to set this up? This is one of the learning curves I'm now up against in order to get started in APRS and packet radio. I hope it's not going to be too steep a climb.

Thanks for any help.

Dave

Try the Alternate VHF settings, and choose the "other" in the pop-up window. It will open a window with APRS VIA and then a blank to enter the alternate path. I am guessing that the software can get the Kenwood to accept parameters that the terminal window won't. Also, if all else fails the initVHF.TNC file in the APRS subdir (assuming you are using WinAPRS) can be edited from a DOS shell using DOS EDIT. That is unless you have "upgraded" to XP and kissed DOS goodbye.

(Oops I pushed SEND too soon on that last reply)

I forgot to point out that the TNC in built into the Kenwood radio itself. I guess the answer is that the SPACE character is vital for getting the full use out of APRS? If so, I'll poke at it more but it seemed pretty clear that the space was not available form the options menu on the radio. Maybe (hopefully) I just missed how to enter it.

BTW: Thanks for the fast reply!

Dave

Im looking to get in touch with any and all Amateurs who currently operate packett.. I have an event planned for the beggining of March 200 and would like to get the word out ahead of time.

Anyone interested in participating or who would just like to learn more about my idea can view all the details at www.qsl.net/kd6nsd/special.htm .. Even if you don't have packett capabilities you can still participate..

Thank you all for your time .... Chris KD6NSD

Cool!

How do I get my 16 radio ports?

I was setting up my laptop for the January VHF Sweepstakes, when I noticed that my shack computer produces a 'birdy' on 50.118 mHz. The computer is an older Pentium laptop, a Dell Latitude XPi with a PI 120 mHz chip in it.

I disconnected all the cables and ran it off the battery: the noise was still there, so it can't be AC line noise. It seems to be the CPU itself, because folding the monitor does little to quiet the noise. I put ferrite chokes on the rig's (a FT-840) power lines, but I didn't notice a difference. Would a balun on the coax help things? If so, what's the diameter it needs to be? I'm using RG-58 coax.

The computer is about a foot away from the rig. The power lines are routed seperately. I tried to move it, but the noise was still there. It only seems to make noise on 50.118, so I think I can live with it, but if there's anything to help the situation I'll do it, because it happens to be right in the DX window...

Thanks for any help in advance.

73s,

Jim

Ham Radio University 2002/ARRL New York City-Long Island Section Convention

North Babylon, New York - On Sunday, January 20, 2002 at 8AM, the doors of the Babylon Town Hall Annex on Phelps Lane will open for the third annual Ham Radio University. Ham Radio University 2002 is a day of education about Amateur Radio.

This year the forums have been expanded and new forums have been added. There will be twenty, one-hour presentations with special forums geared to the non-ham as well as the experienced ham radio operator. The focus will be "hands on" with many demonstrations.

Come join us at the Babylon Town Hall Annex, Phelps Lane, North Babylon, Long Island, and learn about everything from satellite communications, low power operating using radios as small as a tuna tin, how to put up an emergency antenna, the latest information on advanced digital communications, finding and fixing radio frequency interference problems to purchasing your first station equipment or handi-talkie and a special "Ask the Experts" forum. There will also be a Special Event Station W2V set up and operational on HF. There will live SSTV pictures uploaded to the NLI WWW during the event.

TALK-IN W2GSB/r 146.685   -600   110.9 PL

HRU 2002 is sponsored by the Great South Bay ARC and is a cooperative effort between over twenty clubs and organizations in the New York City- Long Island area. It is also the American Radio Relay League, New York City-Long Island Section Convention. Besides the forums, there will be tables set up with information about the different groups, ham radio classes, exam session schedules, public service and other activities.

Join us for a day of fun and education for the whole family!
Admission is open to all - donation is $2 per person.
(complimentary refreshments available)

For more information contact:
Phil Lewis N2MUN, Chairman, n2mun@arrl.net or call 631-226-0698
George Tranos N2GA, ARRL NLI Section Manager, n2ga@arrl.org or call 631-286-7562

im not familar with laptops but look into "overclocking" the proc that should move the birdie away from 50.118

be carful not to chage the speed to high i would say 150 mhz or less would be safe

Use the standard Debian Bug Tracking System for that one. I'm the package maintainer for the node for Debian, so report the problem and I'll take a look at it for you.

regards
Terry

All,

Hope someone with this same configuration can help. I've got a Kenwood TM-G707A and a Kantronics Kpc 3+ TNC that I'm trying to connect via the Kenwood's data port. So far, no luck.   So, here's what I'm up against:

a. The TNC talks just fine to my computer via the serial port
b. No rx or tx between the TNC and radio
b. I know both the radio and TNC are good (both are new)
c. The connector cable was wired IAW the info from both the Kenwood and Kantronics manuals (this is by biggest suspect)

I would appreciate some info or advice from folks out there who have the same or similar setup. My biggest suspect is the cable, but I'm just not sure, so if anyone has built a cable for this application I'd sure like to copy yours!

Thanks in advance and 73!

Brian

> How to spend $325k for six HF email machines...
>

Their requirements are just a bit more demanding than typical amateur radio. The radios are expensive mil-spec as are the crypto equipment and ruggedized lap tops. $55K per system really isn't too bad.

The sad thing is, they already have a huge computer and
CRT's on AWACS. You'd think $325k would be better
spent on some software mods to the.

I suspect a radio isn't part of the deal, as they already
have three HF radios, and no room or antennas for more.

I think all they got was a laptop, a KV-7, and a suitcase.

Could be - I couldn't tell from the article. I know I checked into
some ruggedized laptops a couple of years ago and they were $12K each
for a basic model.

On the D700, use a path like APRS,NOCALL. APRS is the callsign your
packets are sent to; in practice it doesn't matter much what that is,
and APRS is a pretty safe choice. After a comma, you list all of
the repeaters you want to use -- in this case, NOCALL.

Typically for local use you might use APRS,RELAY,WIDE or
APRS,WIDE2-2 or similar.

The product involved is probably this Rockwell-Collins system:
http://www.rockwellcollins.com/ecat/gs/Flyaway_Briefcase.html?smenu=1

Considering the amount of development work involved (STANAG 5066
appears non-trivial to me) and the relatively small number of units that
will probably be sold, they probably aren't whacking Uncle Sam any worse
than usual. :-) What they got was a really sophisticated modem and
some pretty nice, easy-to-use software. I've seen the comparable
Harris product, which is really slick.

Well, after working in the Defense industry here in the Midwest, ya'll should feel lucky that SBC technicians or autoworkers do not build them. The system would be at least 3 times that cost. (I worked for SBC where techs in the wireless side made more than me as a manager, in some case $70 to $80 K per year!)

Defense people do not make quite that money, at least that's what I have found out coming back from the Teleco Industry.

Besides there is a lot of development that goes into these military systems with contractal caps on the profits made. I just bought a KAM-98 and it was not exactly cheap, the other commerical units for Marine cost even more. These units are usually not Mil-Spec for rough use.

Hello.
I have just started using low power telemetry modules connected to basic stamps.
Im quite new to this but have a good knowledge of electronics.
My question is, as this system is two way i have to have 2 antennas, how would i go about using just 1 without using a relay?, mosfet??.
Obviously i cant just connect an input and output together TX,RX Can i?

Thanks in advance
Antony

Take a look at Pin Diode switching circuits.
Basically you short the receiver input during transmit.

Some radios even go so far as to shut down the
whole receiver (Icom brand) as well.

In QRP practice, a very simple diode TR switch is the practice. This doesn't keep all the transmitter energy from making it to the receiver, but keeps the level down to where it doesn't damage anything. Looks something like:

```
                    | |
   Xmit+Ant --------| |------------mmmmm-------- Rcvr
                    | |   |     |
                         ---   ---
                         \ /    ^
                          v    / \
                         ---   ---
                          |     |
                          -------
                             |
                            Gnd
```

Well, OK, my inductor doesn't look so good but you get the idea. Usually the cap is variable so you can tune it to the operating frequency, but it's pretty non-critical so you can calculate and come close enough.

If you have a human listening to the receiver, you still need some sort of
muting circuit so he doesn't get his eardrums blasted, but it sounds like
you don't have that situation.

..

changing the CPU freq probably won't do anything - on this type of pc its
the system bus that runs at 50mhz!

Hi,

My Kenwood TM-D700A has no GPS connected to it, but I entered my geo coordinates manually into the APRS->MY POSITION (3-4) menu location. After transmitting some APRS status messages onto the network, I go to the FINDU.COM query screen and the map position is *always* wrong. I haven't done a lot of experimenting yet but it seems as if the "seconds" field of my position setting is being ignored or interpreted differently than what I thought it was. I even fiddled with the coordinates type

I enter my position as DEGREES/MINUTES/SECONDS and the map location on FINDU.COM shows that I'm about a 1/4 mile away from where the pos is supposed to be. Then I go back and fiddle with the coords and take another look at the updated map and the position has NOT moved, even though I confirmed that a recent packet was received.

Does anybody know why this is happening? I suspect it doesn't happen when using a GPS unit connected to the radio.

Thanks,
Dave

The position input on my D700 is degrees, minutes, decimal minutes - not
seconds.

How about we go 1 step further, just eliminate licensing all together, that way no one has to be responsible for any thing at all. This way we could achieve unlimited numerical goals.

But back to the normal world, are you saying certain minorities are incapable of handling the testing structure as it stands? This in itself sounds racist by implying certain groups have the inability to achieve what other people have achieved.

After having been a Ham for over 30 years, I have met people of all races, creeds, etc. that managed to pass the amateur tests. Most passed it under the FCC back in the days before CW was one minute of copy plus multiple choice test, when one had to send as fast as they received to get their license as well. I also have yet to see anyone turned away from current exams because of all the above noted personal criteria.

As far as computers, cell phones etc. are concerned I pay my Universal Service Charge every month to insure the inter-city has its connectivity. I cannot get the services available to people in the inter-city (i.e. high speed internet or for that matter a landline that works right for more than 2 months) because there is not enough customers were I live. However, the minority section of my town is completely wired with fiber optic phone service and cable modems.

The reason people are not clamoring for Ham radio is that in today's society one can talk to Russia or wherever from their cell phone. The magic of communications is gone, no longer do you have to tune into a Short-wave Broadcast Station to hear the BBC, etc. it is all on the internet.

It is my opinion Martin Luther King's goals did not include a hobby as such as Ham radio. The man had "bigger fish to fry", plus he did not profit in the way his so called Disciples have, i.e. money, etc.

That's my opinion like it or not, beside take this junk to Ham Radio Misc newsgroup.

THOUGHFULLY YOURS,

UB90

Many modern BIOSes have an option called "Spread Spectrum".
Applying that option will spread the clock noise over a larger bandwidth.

Good idea - BUT... this is not a new up to date pc we're discussing. and the trouble with changing the bus clock crystal -(if it has one) is that so many components depend on that timing that the entire system will most probably grind to a halt.

Is it possible to coat the entire case of the laptop in a conductive film of some sort? - to shield it - the trouble seems to really be that most laptops - unlike desktops have plastic rather than metal cases.

I doubt that anything will grind to a halt when you change the clock by
half a percent or so, but I have not tried it.

Done various Google searches for this no avail. Quite interested in trying to access some far away repeater via one of the local ones but require two pieces in info. Which of my local repeaters has this facility and what are the four digit DTMF codes for the distant sites.

Any pointers appreciated.

Martin

Hi Martin, Are you refering to IRLP (Internet Radio Linking Project)?
This URL is the stats page, it will give you the Three digit code for the
node, then add 0 to turn on or 1 to turn off. Please read the information page
before using IRLP.
Cheers

I plan to take an extended vacation in Colorado this summer and would like to install a APRS system on my motorcycle so that hams in New Jersey and family could track my movements. Is this possible to do?

Any info/links on this subject would be appreciated.

Thanks,

Jeff Kelly

Yes this is possible to do.
There are much more knowledgable than, but....
For others to track you - non hams- www.findu.com is one source
For you to get there:
GPS receiver + APRSand TNC(packet) + ham rig
As these are really general topics, your next step (2x1 callsign)
would be to identify which of the three components do you have?
Latest issue of QST has some stuff great for motorcycle.
Respectfully,
TTWB

Seeking any assistance on wiring up PSK to my Icom IC-751. Understand it can be done with two wires utilizing the VOX instead of the three which requires the serial port for PTT. Is it possible to send the signal (out) from the sound card into the back of the rig or must I use the eight pin mic connector to the front of the rig?

Thanks.

Hi guys.

Just a reminder that I carry most if not all PSK, RTTY, MFSK, SSTV etc etc software's on my site. The page is regularly updated too. I also promote my range of soundcard isolated interfaces there too. So if you are looking for something please go take a nosey :-).

Usual errors are to get the plug view back to front..
Or to confuse RX and TX audio..
Read the small print.. carefully..

Regards
Bob

That's funny.  I've served in the Army with plenty of African Americans.
None of them seemed to have trouble making the morse code requirement for
their particular signal specialty (and some, who were morse intercept
specialists, had to copy up to 20 wpm).  Sorry, your argument doesn't hold
up in the light of day.

Just a thought that's been kicking 'round my gray matter...

APRS can give the exact GPS-measured position of anyone who cares to hook up their GPS receiver, TNC, and transceiver. Base or mobile, it matters not. All is revealed in a few squirts of data, in real time.

Has anyone given any thought to the potential for abuse of this data, or the APRS system in general? If so, how did such thoughts change the way you work with APRS? (assuming you made any sort of change).

Curious...

As a ham in the USA, anyone seeing your callsign can find your exact
location (assuming you haven't moved house recently) in a few seconds.

So what difference does it make if you send it in an APRS beacon?

It is the decision of the APRS transmitting user to provide this
information to the public.  If you believe your privacy may be hurt, or
your position data abused, just don't use APRS.

On the other hand, it could be that you are easily located after some
accident, or you could locate your car after it has been stolen.

I considered the privacy issue as well, but considered what the
overall intent of Ham Radio and how open it is, I am not concerned.
In Hamming I don't have an expectation of privacy.
In the use of my phone I do have an expectation. (again expectation).
E-mails I have less of an expectation.

But APRS I find it interesting that my position course and speed is
given out - and that is many times above the speed limit!

I enjoy seeing who may be near by, to see if I can raise them on
simplex.
I guess I am just used to giving out my QTH in most all of my
transmissions.

Big Brother is watching, but I think he is bored with most hams!
Respectfully,
Todd

No, your position, course and speed aren't "given out", you *choose* to
give them out!

If you go to the mall, you could be kidnapped. So
don't go to the mall.

If you ride your bike, you could be hit by a car, so
don't ride your bike.

Hi,

I'm looking for a good condition, working HAL ST-6 modem to interrface with
Model 15 TTY. (I'm working backwards from Soundcard toward smoke signals

these days!)

Please advise details and price you are asking.

Thanks,

Jim Andrew

Hi all & Happy New Year
 Is it possible to do HF Packet, and/or Vhf Packet using a soundcard? If so,
what software is availible to do this? Or can this only be done is using a TNC?
 Thanks for all replys

I would have expected some type of reply from a vendor.   The question was
on the newer software.

I think you are running skysweeper in the demo mode. In the demo mode most
of the decoders will not support soundcard.
If I remember correctly, some analysers can be run fully (with soundcard
support) in the demo mode as well as some decoders (MFSK16 etc).
The most of the decoders can only be tested in the demo mode by reading
signal from the file.
I know many registered skysweeper users and never heard any soundcard
problems.

Anyone who has experiensed how to use the "Data-plug" in the rear and
actually use software like "HamScope" ?
The user-guide seems to be somewhat erroneus, and i have no clue of how to
get it done succesfully.
The pin 1 should be audio in
Pin 2 GND
Pin 3 PTT
Pin 4 Data (Sound) out at 9600bps
Pin 5 Data out at 1200 bps.
Pin 6 Squelch-control open at +5v closed at 0 v.

However, closing pin 3 to ground does not activate PTT...
Sound comes out of pin 6 !

Thanks for all help--

T.

The 847 has a port like this for FM data (packet) only. For digital
modes like RTTY etc there is an HF data port. Maybe the 817
has something similar?

AMATEUR RADIO NEWSLINE(tm) REPORT #1273 - January 4 2002

(Total Running Time with RAIN Promo: 24:48)

==

A NOTE TO THOSE WHO ONLY “READ” AMATEUR RADIO NEWSLINE(tm)

For those of you who only know of the Amateur Radio Newsline (tm) as a text newsletter we would like to invite you to listen to the audio version. This Amateur Radio Newsline (tm) script is actually written for the “spoken word.” It is recorded each by professional broadcasters and is available for private listening or rebroadcast over your repeater. Three methods of delivery are available: Streaming audio using RealAudio, FTP RealAudio, FTP MP3 or dial-in telephone. Please visit our website at http://www.arnewsline.org for a list of telephone numbers (you have to pay your own long distance charges) and links to audio servers providing our voice newscast. On site free FTP Downloads are available at our site by clicking on the newscast number at the top of the page.

de
The Newsline Production Team

===

Amateur Radio Newsline report number 1273 with a release date of Friday, January 4 2002 to follow in 5-4-3-2-1.

The following is a Q-S-T. A “V-E team” finds a way to test kids in one of the most remote regions of the country and the FCC again says no to expanding PRB-. These stories are first on Amateur Radio Newsline report number 1273 coming your way right now.

HAM RADIO TESTING REACHES WHITE MOUNTAIN ALASKA

Ham radio examinations have finally come to one of the remotest areas of the nation. This, after a team of examiners from the W5YI VEC perform a fly-in examination session in White Mountain Alaska. Amateur Radio Newsline's Norm Seeley, KI7UP, has the details:

--

White Mountain is a remote fishing village in the far North-West of Alaska. It's major claim to fame is that its the next to the last checkpoint for the famed Iditarod dog sled race. And it wanted someone to come in and give ham radio exams.

The closest big city is Nome. White Mountain is only about sixty miles from Nome but its over some rather treacherous terrain. There are no roads in or out and all supplies to White Mountain have to be delivered by plane or boat.

But White Mountain does ham a ham radio operator for its mayor. He is reindeer farmer Tom Gray KL0CQ. And one of its school board members is Eric Morris KL7HT. Both will tell you that a temperature of minus 40 degrees Fahrenheit and a wind-chill factor of minus 100 degrees is not uncommon in winter. These were the conditions faced by a four member W5YI VEC test team when it chartered a plane and flew in on December 11th to administer exams to four adults and fourteen youngsters who were determined to make ham radio a part of their life.

The trip which cost $800 for the flight alone was sponsored by the Seward Peninsula Amateur Radio Club. Braving the weather were examiners Ramon Gandia AL7X, Michael Nurse KL7UJ, Scott Webber AL7RJ and Thomas Busch NL7H. Al four are from Nome. Most of those to be tested came from the Bearing Strait School District's only inland school.   They had all been studying for their Amateur license as part of a search and rescue course. Neither the applicant or the VE team were disappointed. All eighteen passed the Technician class exam.

For the Amateur Radio Newsline, I'm Norm Seeley, KI7UP.

--

Those involved in ham radio testing are keenly aware of the problems faced by remote areas of Alaska. At last July's VEC Conference in Gettysburg Pennsylvania Jim Wiley KL7CC told the group that many applicants in Alaska are denied n Amateur Radio license exam due to the inaccessibility of their locations or the high cost of travel in that state.   (W5YI)

**

HAM RADIO AND THE LAW: FCC SAYS NO ON PRB-1 EXPANSION REQUEST

Ham radio has lost yet another battle against deed restrictions, but the war is not over yet. At least that's what the ARRL appears to be saying in a bulletin that describes the latest skirmish with the FCC over this politically volatile issue.

In the latest round, the FCC has affirmed a November 2000 staff-level decision that declined to include privately imposed deed covenants, conditions and restrictions under the limited federal preemption known as PRB-1. That's the federal government policy requires municipalities to ''reasonably accommodate'' amateur communication in antenna-related zoning and regulation.

The ARRL last year appealed to have the full FCC review the earlier denial. The Commission turned down the League's Application for Review December 18 in a Memorandum Opinion and Order released December 26. As a result, it now looks as if the ARRL will bypass any further dealings on this issue with the FCC and will look for congressional relief instead.

The FCC itself even hinted that Congressional action by the ham community might be a next logical step. Its memorandum, opinion and order of dismissal did note that if Congress were to see fit to enact a statutory directive mandating the expansion of the FCC's reasonable accommodation policy that the Commission would expeditiously act to fulfill its obligation there under. Translated: If Congress tells the FCC to include deed restrictions under the provisions of PRB-1, it will be more than happy to do so. (ARRL)

**

HAM RADIO IN SPACE: PROJECT JJ - HE EAGLE HAS LANDED

AMSAT-NA's newest satellite project, known as Project JJ for the past year, now has a new and official name. This, as AMSAT North America President Robin Haighton, VE3FRH, announces that effective January 1, 2002, the satellite will officially be known as 'Eagle'.

The name Eagle was submitted by Bill Allen, W7US, of Tucson, Arizona. It was selected from a list of forty-five names submitted by twenty-nine satellite operators.

For his winning suggestion, W7US will receive a free dinner at the annual AMSAT dinner held during the Dayton Hamvention. We will have more ham radio space related news later on in this weeks Amateur Radio Newsline report. (AMSAT-NA, ANS)

**

BREAK 1

Welcoming in the new year with ham radio news coming to you from the United States of America. We are the Amateur Radio Newsline, heard on bulletin stations around the world, including the N7VGS repeater serving the Salt River Star Valley Wyoming and congratulating 13 year old Devin Cassity, on becoming the youngest ham in South West Wyoming. Devin is now KD7PHN.

(5 Sec Pause Here)

**

EMERGENCY PREPAREDNESS: NORTHERN CAL TOWN CHOOSES HAM RADIO

Ham radio started the year with some very positive public exposure in the Los Angeles Times. The January 1st edition featured an in depth article about a Northern California town that will tap into older technology to prepare for future emergencies.

Worried that a disaster will knock out e-mail and cell phones, Los Altos Hills has decided to turn to its local ham radio community and make it the primary back-up to normal disaster preparedness communications. And as you might expect, the hams are more than ready to oblige

The complete story can be read at the Los Angeles Times website. The complex URL is http://www.latimes.com/news/local/la-000000203jan01.story. (Highlighted by ARNewsline™)

**

AMERICA AT WAR: POPCOMM COLUMNISTS SAYS “DONT TURN THE OTHER CHEEK”

Popular Communications writer Eric Force has some strong words that are obviously aimed at the pacifists who oppose the United States military retaliation against Osuma bin Laden and his al-Quida terrorist network. As a response to those he calls the “do-gooders of the world” who promote turning the other cheek, Force says to look, really look at the attack that brought down New York City’s World Trade Center twin towers. He then says that it could have struck a lot closer to them.

Force says and we quote: “Consider that it could have been you, your mom, dad, brother, sister other relative or a close friend in those planes and buildings who were terrorized, murdered and buried in the rubble.” He adds that just thinking about the incomprehensible terror, suffering and losses incurred by innocent human beings a the cowardly hands of international thugs continues to tear at his heart.

Force has dedicated his latest I-Waves column to the sights and sounds of September 11th that are available on the Internet and to the victims of the tragedy. Its a very compelling article. You can find it starting on page 66 of the January edition of Popular Communications Magazine that’s on newsstands right now. (PopComm)

**

AMERICA AT WAR: FEDS TO AID NYC TV STATION REBUILD

New York television stations will be getting federal help rebuilding transmitters that were destroyed in the September 11th terrorist attack on the World Trade Center. A total of ten New York area stations will receive eight point two million to offset the thirty million to forty million dollar price tag for purchasing and constructing a new transmission facility.

According to the Broadcasting and Cable newsletter, Senator Charles Schumer managed to secure the funding as addition to emergency aid appropriation for victims of the attacks. As previously reported, there is some speculation that the replacement transmitting facility could be a 1500 to 2000 foot high stand-alone tower constructed near the former site of the Twin Towers.
(Broadcasting & Cable)

**

ENFORCEMENT: NAL CANCELED

The FCC has canceled a proposed ten thousand dollar fine that it had issued to Jeffrey Alan Pettrey, This, for his apparent violation of Section 301 of the Communications Act involving operation of an unlicensed radio transmitter.

Back on July 30, 2001, the District Director of the Commission's Columbia, Maryland Field Office issued a Notice of Apparent Liability for Forfeiture in the amount of $10,000 to Pettrey for the infraction. Pettrey filed a response to the N-A-L on August 7, 2001 accompanied by documentation regarding his inability to pay the proposed fine. After reviewing Pettrey's response, the FCC conclude that cancellation of the proposed $10,000 forfeiture is warranted based on Pettrey’s inability to pay. (FCC)

**

ENFORCEMENT: FCC CANCELS CONVICTED HAMS LICENSE

The FCC has canceled the Amateur license of Kenneth P. Kelly, WT2FBI, of Greensboro North Carolina after Kelly failed to show up for a re-examination. But at the time of the FCC retest order Kelly was otherwise occupied. He was fighting criminal charges in relation to a jamming case in Ohio. We have this report:

--

On November 30, 2001, Kenneth Kelly, the ex-WT2FBI was sentenced to 5 years probation by the Judge H. J. Bressler in a Butler County Ohio court. He had previously been indicted on a 4 th degree felony charge of disrupting public service by his jamming and talking on the Middletown Ohio police radio system.

At his hearing, Kelly agreed to a plea bargain. He admitted his guilt to a reduced charge attempted disrupting public services. At the time the FCC pulled his ham radio ticket Kelly was being held in the Butler County Ohio Jail pending sentencing.

By way of background, a person later proven to be Kelly was first noticed on the Middletown police radio channel the third week of July 2001. Initially the police dispatch radio system was not recording him but that was soon remedied by city radio technicians. After several days of taping, it was observed that the voice on the police radio was similar to one heard on the local 2 meter Amateur frequencies.

Several members of the Dial Radio Club then assisted police by monitoring and taping Kelly on the 2 meter band. Tapes from 2 meters and from the police were then voice printed the aid of computers to check similarities. Dial club members also tried to direction find and locate the signal both on 2 meters and on the police channel.

Through some luck, detectives working with a metro housing police officer and discovered that Kelly was now living in their jurisdiction. After they interviewed him, they felt that he was the person interfering. As the investigation progressed, he admitted to detectives that he may have accidentally transmitted on their frequency by accident. He claimed that his signal may have been mixing with an FM broadcast station and another ham repeater.

But Police did not believe it was accidental, because he was taped trying to talk directly to the police dispatcher and the cars. Later Kelly did admit his guilt and entered into the plea bargain. Now sentence has been passed by both the local court and the FCC.

For the Amateur Radio Newsline, I'm Burt Hicks, WB6MQV, reporting.

--

When he was finally caught Kelly had a Yaesu VX-5 hand held in his possession that had been modified to transmit out of band. The assistance of the Dial Radio Club members is credited with helping to solve this case.

Note: Information and documents from the case can be obtained from the Butler County Ohio Clerk's office or online at: http://www.butlercountyclerk.org/ Click on Butler County Court Records Search. Then enter Kenneth Kelly. (FCC, Dial ARC, others)

**

ENFORCEMENT: MITNICK TO FIGHT TO KEEP HIS HAM LICENSE

Another ham who appears to be getting ready to do battle with the FCC is former computer hacker turned talk show host Kevin David Mitnick, N6NHG. Amateur Radio Newsline's Bill Pasternak, WA6ITF has the latest:

--

As reported last week, the FCC is challenging Kevin David Mitnick's request to renew his ham radio license. The agency claims that his criminal background raises a substantial and material question of fact as to whether Mitnick possesses the requisite character qualifications to be and remain a commission licensee.

Now, N6NHG has told the U-K Newspaper the Register: "It's just another example of them trying to harass me. Now I've got to spend money to keep a ham license."

Mitnick insists that he has totally abandoned his former ways. The Register article notes that that he was recently called to testify before Congress on federal computer security matters. Also that he spent two days briefing the U-S Commission on National Security on these issues. Mitnick tells the Register that he cannot understand why the government is now questioning his character.

Mitnick is currently the host of the radio program called The Dark Side of the

Internet. It airs in the Los Angeles area from 5 to 7 a.m. Sunday mornings over radio station KFI 640 AM. And in a recent appearance on Coast to Coast A-M hosted by Art Bell, W6OBB, Mitnick said that he is hoping for a career in computer security once his term of supervised release from prison has been completed.

For the Amateur Radio Newsline, I’m Bill Pasternak, WA6ITF.

--

The complete Register story and interview with Mitnick is on the web at a rather long and complex U-R-L. You will find it at http://www.theregister.co.uk/content/55/23494.html (Adapted from the Register)

**

INTERNET SECURITY: CIA GOES OUT OF ENCRYPTION COMPANY FUNDING

And speaking of Internet security, word that a Central Intelligence Agency funded company that allowed Web surfers to browse anonymously has closed. According to news reports, Emeryville California based SafeWeb enabled Internet users to gain access to the World Wide Web and browse sites through its encrypted service. This made their on-line habits and history untraceable. In the 2000 - 2001 fiscal year, SafeWeb received one million dollars in funding from the U-S Central Intelligence Agency's venture capital arm. (published reports)

**

HAM RADIO BUSINESS: AMATEUR RADIO TRADER CEASES PUBLICATION

Ham radio Internet auction sites may be responsible for a twice a month ham radio equipment sales magazine going away. This, after Amateur Radio Trader magazine announces that it has ceased publication.

According to Editor Barbara Patterson, KF4MMV, the Amateur Radio Trader was no longer a viable product. She says that the firm will be redirecting its resources into other areas.

Meantime, the company has also pulled its amateuradiotrader.com website off line. But unlike other publications which have gone under, in this case subscribers are being reimbursed for any outstanding issues. In addition to handling buy and sell ads, Amateur Radio Trader also donated page space to advertising the annual Newsline Young Ham of the Year award. (ARNewsline™)

**

HAM RADIO HERITAGE: MAKING WCC A PART OF THE FUTURE

A ham is campaigning to preserve part of radios past and have it become a part of the future. This as Lewis Masson, K1LJ-S, says that the town of Chatham Massachusetts should convert the site of radio station WCC into an Amateur Radio station along with a training curriculum to teach the kids in the area about communications technology.

WCC is one of the original Marconi Marine Radio Stations. Masson is an ex-marine telex operator at WCC. The site was recently turned over to the town of Chatham and Masson believes it is important to preserve the operations building as an operating amateur radio station and keep the hotel building as a museum to preserve and display memorabilia.

Masson says over the Internet that he has formed a committee to work on this project and that they are looking for nationwide support for this campaign. If preserving the past as an investment in the future is of interest to you, please contact K1LJS by e-mail to lemasson@juno.com. (Internet)

**

SPECIAL EVENTS: HAM RADIO UNIVERSITY 2002

A reminder the third annual Ham Radio University event takes place on January 20, 2002. Location is the Babylon Long Island New York Town Hall Annex with the doors opening at 9 a-m Eastern time.

Ham Radio University is a day of education about Amateur Radio. This there will be twenty, one-hour presentations with special forums geared to the non-ham as well as the experienced Amateur Radio operator. The focus will be "hands on" with many demonstrations. Besides the forums, there will be tables set up with information about the different groups, ham radio classes, exam session schedules, public service and other activities.

For more information about Ham Radio University, please contact its Chairman Phil Lewis N2MUN by e-mail to n2mun@optonline.net. You can also get in touch with ARRL New York and Long Island Section Manager, George Tranos N2GA by e-mail to n2ga@arrl.org. Also check the Ham Radio University website for a full list of forums, directions and talk-in information. Its in cyberspace at www.arrlhudson.org/nli/hru2002.htm (N2DO)

**

HAM RADIO RECORDS: BEST OF THE WEST AND VHF CONTEST HONOR ROLLS

Tim Marek, K7XC, says that he has updated W6 / W7 & "Best In The West" VHF Contest Honor Rolls. They are now available at the following web sites.

http://k7xc.tripod.com/VHF_Records/index.html s the stand alone records page.
http://k7xc.tripod.com/K7XCweaksignal/ is where individual links can be found

to each contest. (VHF Reflector)

**

HAM RADIO SCIENCE: NEW 6 METER PROPAGATION BEACON IN WASHINGTON STATE

Rich Ewing, KO7N reports over the VHF Reflector that Bruce Shurtz, W7BAS, has installed a propagation beacon in gridsquare CN87TG near Kennmore Washington. It operates on 50.069 MHz putting out 10 watts to a 5 element yagi pointing 90 degrees. The beacon is operational 24 hours a day, seven days a week. QSN reports go to W7BAS, at his callbook address. (VHF Reflector)

**

HAM RADIO IN SPACE: VERY FEW LAUNCHES

Peter Guezlow, DB2OS, reported that 2001 has turned out to be the slowest year for space launches in nearly 40 years. Ham radio or otherwise. According to DB2OS, only 58 flights reached orbit, and there was one complete failure.

Guezlow says that historians note that we must look back to 1963 to find a year that produced fewer launches. He says that in 2000 there were 82 launches to orbit plus three failures. By contrast the most productive year was 1984 when 129 launches delivered payloads into orbit.

But there is at least one bright note. Russia successfully placed five satellites into orbit recently after launching them aboard a Zenit rocket. The cargo rocket, carrying three Russian, one Moroccan and one Pakistani satellite, took off from the Baikonur space center in Kazakhstan. (AMSAT, ANS)

**

HAM RADIO IN SPACE: NEW INDIA WEBSITE

The AMSAT-India website has been officially launched recently by the government of India and the Department of Space. VU2POP says that you can check it out by taking your browser over to www.amsatindia.org. (ANS)

**

CONTESTS: HUNTING LIONS ON THE AIR

The 31st annual Hunting Lions in the Air contest will take place on the weekend January 12th to the 13th. The contest period will be 48 hours and will run from midnight UTC Friday night to midnight UTC Sunday night, and all hams are welcome to participate.

According to its sponsors, the objective of this operating event is to create and foster a spirit of international understanding and cooperation among radio amateurs and members of the Lions Clubs through the use of world-wide radio communication. The contest also commemorates the birthday of Melvin Jones, the founder of the Association of Lions Clubs who was born at Ft. Thomas, Arizona on January 13, 1879. (Q-News)

**

DX

In DX, word that the recently postponed Ducie Island Dxpedition is on again for March. Ducie Island became a DXCC entity last November and it immediately jumped to the top of the most wanted contact list. But rough seas scuttle the first attempt to put it on the air. (RSGB)

Meantime 6 meters continues to be the V-H-F D-X band of choice. On Monday December 31st, Kevin Bishop WB8XX, says that he started hearing O-H-1-X-T at 1300 U-T-C on a backscatter path. From then on until 1620 U-T-C he worked 8 new countries and over thirty new grids in Europe and Asia. (VHF Reflector)

**

STRANGE TECHNOLOGY: ARE CELLPHONES KILLING GHOSTS?

Now, from radio communications to the effect of radio communications on supernatural communications. This, as a British expert who has spent years researching the occult says that cellular and other mobile phones are killing off ghosts. Don Wilbanks KC5MFA has the details:

--

No, we are not kidding you. In fact, Tony Cornell, of the Society for Psychical Research, has told the London Sunday Express that reports of ghost sightings started to decline when mobile phones were introduced 15 years ago.

According to Cornell, ghost sightings had remained consistent for centuries. In fact, until three years ago the society received one or two new ghost sighting reports every week. But with the introduction of mobile phones 15 years ago, ghost sightings began to decline to the point where they are not receiving any.

And why are there no longer any ghosts being observed? Apparently paranormal events, which many scientists attribute to unusual electrical activity, my be drowned out by the electronic noise produced by cellular telephones and text messaging pager transmitters. And according to the newspaper, the lack of ghost sightings could adversely impact on the nations economy. It says that haunted tourist attractions in Britain could be under threat if the number of cellphones continues to grow from the present figure of about 39 million now in use in the U-K.

Don Wilbanks, KC5MFA.

--

And all of this begs that one question be asked. If ghosts are the spirits of the dead, how can anything actually kill them? (Science Today)

Pretty much the same as a sound card - Rx audio, Tx audio, PTT, and ground. If you don't have the P38 manual, I'd get one from HAL before proceeding.

I used the information on K6XX's website, search for BBox.

You may be looking at the pins the wrong way around, for PSK31 I just wired DATA OUT to SOUND in
DATA IN to SOUND OUT and PTT on the 817 to the collector of a 2n3904, whose base came from DTR, pin 4 of a 9 pin D-type connected to a COMport. The ground of the transistor, PIN 5 of the 9 pin and shields of the two 3.5 MM jacks going to the sound card goto to ground on the FT817.

Unfortunately I would have to disassemble my plugs to figure out which way around the pins are numbered.

It does work nicely on digipan...

Some questions re PSK31...

I am just getting started with PSK. It's very entertaining, and at least for me, a new way to combine and explore ham radio and computer capabilities.

I have tried a number of PSK programs, Digipan, Winpsk, Wpwin and NcWinPtc. Most recently I looked at W1SQL's program. It is pretty slick displaying up to 20 QSO's at a time instead of one or two.

I certainly like and see the advantage of the "Waterfall" frequency display. I see that most if not all but one so far, NcWinPtc, require a sound card and an audio interface. If possible I'd like to avoid having to buy or build an interface. I already have a great TNC. It's an SCS PTC-IIe. I use it primarily for Pactor II email. as a frequent maritime mobile.

My computer(s) are two Toshiba Tecra laptops, one older a Tecra 500, and one newer, a Tecra 8100. Both appear fast enough to handle the various PSK software apps I've tried so far. SSB is an Icom 728.

Question 1: Since I'm using laptops with built in sound circuitry, is the sound circuitry in the two laptops up to the task of sending and receiving PSK if I bought an audio interface?

Question 2: Does anyone know of a TNC compatible PSK program with a "Waterfall" frequency display?

Question 3. I'm wondering if there is a consensus around the most desireable or undesireable interfaces or the most desireable or undesireable qualities in an interface, ie what to look for or avoid?

Thanks tons for your help...

PSK doesn't take anything fancy in the way of sound cards. If your laptops are fast enough to be reasonable running WIn 9x, then they should be fine for PSK.

As mostly a homebrewer, this idea of "buying" an interface seems a little alien to me. I would suggest running a wire from the headphone jack of your rig to the sound input of your laptop and see how well you can receive. If you are terrified of a soldering iron, now you can invest in an interface confident that you have enough computer to do the job. If you don't mind melting a little solder, lash up an optical coupler between the rig and the serial port and away you go.

> Question 2: Does anyone know of a TNC compatible PSK program with a "Waterfall" frequency display?

This is a little like asking if anyone knows of a sports car compatible with a particular brand of horseshoes. Your TNC has nothing to do with PSK-31. Even though they are similar in that you hook them up to a rig and type to other hams, technically they are very dissimilar. It's very hard to do packet in software, but easy in hardware. It's hard to do PSK-31 in hardware, but easy in software.

The only PSK-31 hardware I've seen is a box that George Heron built, and threatened to kit through NJQRP. It translates between PSK-31 and Morse, so that you can send with your paddle and receive with your ears. No waterfall display, tho. He did have an LCD on the front that displayed the letters received, and he did have a port for a keyboard. The idea was that when coupled with the NJQRP PSK-31 transceiver, it could be a lot more portable than lugging a laptop. Of course, the PSK-31 decoding was still done in software, just not on a PC. I haven't seen the kit appear yet, so I'm guessing it turned out too expensive.

> Question 3. I'm wondering if there is a consensus around the most
desireable
> or undesireable interfaces or the most desireable or undesireable
qualities

> in an interface, ie what to look for or avoid?

There's really nothing to the interface, so good/bad is mostly a matter of personal preference. The only significant difference I'm aware of is that some use a transistor to key the rig, others an optical coupler. The more paranoid may prefer the optical coupler.

IMO, it's a bit of a red herring, tho. The coupler, in principle, makes it impossible for the rig to toast the computer, and vice versa. But it only applies to the keying line. The audio lines are still a risk. I suspect a pretty small risk, however. Might matter if you are using a really old tube rig with bunches of volts on the keying line.

Some of the fancier ones provide a sort of patch panel functionality that let you select several rigs and/or computer inputs. I haven't seen the problem on PSK, but some software based RTTY and CW programs seem to be picky about whether they use the mike or line inputs. Being able to select between them by a switch, instead of crawling around behind the computer, could be a plus, especially if the level difference could be dealt with at the interface.

I beg to differ. The SCS PTC-IIe will decode PSK-31 very well. But there is
no software that will make a waterfall display out of it's output.

When it comes out of the SCS PTC-IIe the data is already decoded.

The SCS PTC-IIe has it's own tuning indicator

This is also a software solution, it's just that the software is in the box. The onboard processor, a 68020, is roughly the equivalent of a low-end Pentium, but it's helped along with a second processor, as well as 4 communications controllers and a hardware CRC unit. The typical TNC has perhaps a tenth this processing power.

This is kind of an interesting box, superficially it looks a lot like a fancy TNC, but in many ways, it's quite different.

What it does is combine PC class processing capability with TNC like USRT and CRC capability, allowing it to do both packet and PSK. The communications controllers can apparently be programmed to be either USRT's or UART's, allowing the device to do RTTY and other asynchronous protocols as well. Most of these asynchronous protocols are easily handled by either hardware or software, and most are available in most mid and upper range TNCs, as well as in endless shareware/freeware programs. Most people don't have synchronous serial capabilities on their PC, and the CRC calculation is burdensome in software, so only recently as PC's have gotten a lot more powerful have you begun to see packet approaches based wholly on software. It's the combination of PSK and packet in one box that makes this thing a little unique.

The PTC-II and the TNC is also not burdened with all the other
overhead running in a PC.

No disagreement about it being a software solution. It's worth pointing out though that the 'second processor' is the one that actually does just about all the hard work for the HF modes, it's the digital signal processor.

Terry

There is no reason why a waterfall-capable program cannot be run in
receive-only mode simultaneously on the same computer with the PTC
tnc. That way, you see the activity on the waterfall AND get the
better(?) copy from the hardware tnc.

But you'd still have to tune the receiver to put the desired signal on

the TNCs tone frequency. I guess you could use MixW and configure a macro to tune the receiver. I seriously doubt that my PTC-II will do any better job of receiving PSK31 than MixW or most of the other PSK31 software and its certainly not as convenient to use.

I built a sound card interface that lets me select either the sound card or the PTC-II by pushing one button.

you should try the kiwa loop.
it is better than the two you are inquiring about.
but it is not cheap. about $300 iirc.

Ah ha.

I just discovered this myself. I tried running NcWinPtc and Digipan simultaneously. Result? It works. However how best to synchronize the transmit and receive frequencies of the three elements, the Digipan software, the NcWin Ptc software, and the PTC Leds leaves me a bit puzzled.

Bob

Hi all,

ANyone have a site or info on making your own sattellite reciever for the
"broadcast band" sattellite radio subscription service?  QST has published how
to build all kinds of stuff like that over the years and I haven't seen
anything on it at my library.

tnx
73
chris
For free plans and info on solar oven's water and purifiers, that actually
work, see<http://www.accessone.com/~sbcn/index.htm>

Hi gang,

I have had problems with rf getting into the mic section of the 850 when a KAM/KAM Plus is connected using the 13 pin plug. Kantronics had a fix by installing either a capacitor 1pf or so in the plug. Kenwood also had a fix but it required rig surgery. Anyone know the Kantronics recommended fix. I have been searching all over for it and have not had any luck and I can't seem to find my hand written documentation.

Thanks
Keith

AMATEUR RADIO NEWSLINE(tm) REPORT #1274 - January 11 2002

Amateur Radio Newsline report number 1274 with a release date of Friday, January 11th 2002 to follow in 5-4-3-2-1.

The following is a Q-S-T. No more taxicab Q-R-M plaguing a popular ham satellite and lots of FCC enforcement actions highlight this weeks Amateur Radio Newsline report number 1274 coming your way right now.

(Billboard Cart Here)

**

HAM RADIO IN SPACE: TAXI TO SATELLITE QRM ENDED

Some good news for satellite operators. Thanks to some hard work by the International Amateur Radio Union, the troublesome F-M signals to ham satellites from Mexican taxi cabs are for the most part gone. Amateur Radio Newsline’s Norm Seeley, KI7UP, has the details:

--

According to the IARU Monitoring System newsletter it now appears that FM radio transmissions from the taxi drivers in the cities of San Luis and Sonora, Mexico area are no longer getting into the 2-meter uplink of the UOSAT 14 ham satellite.

The issue was raised by many involved in ham radio satellite communications including Ray Soifer, W2RS, of AMSAT North America. The newsletter says that it was Soifers plea to the VHF and Satellite Committee at the 2001 IARU Region 2 Conference in Guatemala City generated extra interest and concern about this and similar problems. This lead to some very productive discussions between the Mexican telecommunications administration and the Federación Mexicana de Radio Experimentadores which is Mexicos national Amateur Radio society.

Credit also is given to Alejandro Pereida, XE2BSS, for his thorough technical analysis of the problem and for his persistence in pursuing the matter from beginning to end. The end being the removal of the interfereing signals from the UOSAT 14 two meter uplink passband.

For the Amateur Radio Newsline, I’m Norm Seeley, KI7UP, not far from the U.S. - Mexico border in Scottsdale Arizona.

--

The newsletter reports that after a lot of correspondence and negotiations on this issue took place over the past eighteen months. It also credits Lorne Libin, XE1V, as being an important mediator during this period. (AMSAT)

**

HAM RADIO AND THE LAW: NEW HAMPSHIRE HAM WINS ANTENNA CASE

Meantime, a lot closer to the ground, the ARRL Letter reports that a New Hampshire ham appears to have won a battle to erect an antenna support structure on his property. But says the League, it remains to be seen, however, whether Jerry Muller, K0TV, of Hudson will be allowed to erect the extensive system of three towers that he'd originally planned.

Unlike many amateur antenna battles, this case did not pit Muller against the town. In December 1998, Muller applied for a permit to erect three 100-foot antenna structures on his property, and the town of Hudson granted the permit. Three of Muller's neighbors appealed the grant of the permit, but the Hudson

Zoning Board affirmed the grant. The neighbors then sued the town and won, resulting in the order for Muller to dismantle the towers.

Now, in a 4-0 vote, with one justice abstaining, the Supreme Court of New Hampshire has reversed a lower court ruling but it is not a 100% victory. Writing for the court, New Hampshire Chief Justice David A. Brock concluded that the lower court's order requiring Muller to dismantle his towers violated the limited federal preemption known as PRB-1 as well as New Hampshire's statutory codification of PRB-1. However Brock also agreed with the lower court that Muller's three-tower installation did not qualify as a "customary, incidental and subordinate" accessory use permitted by Hudson's ordinance.

While another amateur in Hudson has a tower at the same height, there are no instances of three such towers on the same property. Nevertheless, Brock said that Muller's installation may be permitted within the framework of PRB-1, if Muller can demonstrate that his three towers are necessary to "reasonably accommodate" his communications needs. (ARRL)

**

THE WAR: 73’S GREEN SAYS US COMMUNICATIONS ILL PREPARED FOR TERROR ATTACKS

73 Magazine El Supremo Wayne Green, W2NSD -- thats his title not ours. El Supremo Green says that the United States is ill prepared to handle communications in the event of another terror attack. Writing in his Never Say Die editorial column, Green says that no matter how the terrorist network hits us, the one thing we are going to need is communications. And this says Green, this is another item that the government has been lax in providing.

Green notes that anytime there is an emergency, the first things to disappear are electric power and telephone service. This includes cellular as well as wired phones. He notes that police, fire, rescue and other services have no way to inter-communicate until ham radio operators arrive on the scene. He says that if ham radio is going to be called on to provide services anywhere and at any time, then we need at least 600,000 licensed hams trained and ready to help, and not just the 100,000 or so that are now really active.

Green’s comments begin on page four of the January issue of 73 Magazine. (73 Magazine)

**

THE WAR: PIRATE HAM OPERATION FROM AFGHANISTAN

You may find this hard to believe, but even with a war going on some joker is pirating the YA5T call-sign and pretending to be on the air from war-torn Afghanistan.

According to Peter Casier, ON6TT, and the Radio Society of Great Britain all the operators who had previously put YA5T on the air have left Afghanistan. Casier tells the RSGB that he expects to travel back to Islamabad on the 20th of January and then to Kabul within the following few days. Until then, any station you work claiming to be on the air from Afghanistan is most probably somewhere else in the world.

We will have more D-X news later on in this weeks newscast. (RSGB)

**

BREAK 1

This is ham radio news coming to you from the United States of America. We are the Amateur Radio Newsline, heard on bulletin stations around the world, including the Condor Connection repeater intertie thanks to KC6SFP and heard throughout the South-Western United States.

(5 Sec Pause Here)

**

FCC: THE VANITY CALL SIGN PROGRAM MAY RESUME SHORTLY

Some god news for hams waiting for vanity call signs. According to an ARRL bulletin, the vanity program which was put on hold since October 14th as the result of the post 9-1-1 Anthrax mail scare may could be in operation shortly.

The vanity gridlock got started after mail received between October 15th and November 1st was diverted from the FCC's Gettysburg, Pennsylvania, office for decontamination in the Washington, DC, area. That mail, believed to contain more than 100 vanity applications filed on paper, has not been returned to Gettysburg.

Current FCC policy says that paper and electronic vanity applications get equal processing priority, so the Commission halted vanity processing altogether until it could resolve the mail snafu.

FCC staffers in Gettysburg have been attempting to work around the roadblock. Using vanity fee payment data from the FCC's fiscal agent, Mellon Bank in Pittsburgh, the FCC's Wireless Telecommunications Bureau in Gettysburg has been contacting applicants directly to have them resubmit their applications. The FCC now is asking applicants whose paper vanity filings may have arrived at Mellon Bank between October 15th and November 1st and who have not been contacted to get in touch with the FCC to find out if they need to forward a copy or facsimile of their original paperwork. The request affects only vanity applicants who filed on paper and not electronic filers.

More information on whats happening in the ham radio vanity call sign program can be found at the ARRL Website. Its in cyberspace at www.arrl.org under W1AW Bulletins for the year 2002.

And late word in. The FCC has begun processing some vanity call signs as this newscast is prepared. (ARRL)

**

ENFORCEMENT: EX-KV4FZ’S NEW LICENSE APPLICATION DESIGNATED FOR HEARING

I’m Bill Pasternak, WA6ITF. The FCC has designated a new ham radio license application filed by Herbert L. Schoenbohm, the ex-KV4FZ, for a public hearing. According to the order released on January 9th, the hearing will determine whether Schoenbohm possesses the requisite character qualifications to be a Commission licensee. Schoenbohm lost a series of appeals during the 1990’s and was ordered off the air last year. He was given twenty days to request that the hearing on his new application be held. If he fails to do so, his application will be dismissed. More on this story, next week. (FCC)

**

ENFORCEMENT: YOU CANT SEND FELONY COMPLAINT AFFIDAVITS TO OTHER HAMS

The FCC wants to hear immediately from any ham who receives notification that a felony complaint has been lodged against him or her by Glen Baxter, K1MAN. This after the government tells the Belgrade Lake Maine operator to stop sending other radio operators so-called Standard Felony Complaint Affidavits. Speaking on his Rain Enforcement Log, FCC Special Counsel for Amateur Radio Enforcement Riley Hollingsworth says that this is not the first time Baxter has been warned:

--
Hollingsworth: “We reiterated a warning issued by the United States Attorney in Maine to a Belgrade Lakes operator who had sent so-called Felony Complaint Affidavits to licensees who had refused to clear the frequency for his broadcasts, or bulletin shows or whatever they are. Complaints about the nature of the transmissions are also under review as well, and we will be looking at those. That went to Glenn Baxter, K1MAN.

The United States Attorney in that case has warned Baxter that if he continues sending the so-called Felony Complaint Affidavits he may be subject to federal criminal charges for misrepresentation and for using the U.S. Mail to make threats.”
--

If you receive one of these Standard Felony Complaint Affidavits, or notification that one has been filed against you please contact Riley Hollingsworth as soon as you can. He can be reached by e-mail to fccham@fcc.gov. (FCC)

**

ENFORCEMENT: FCC - ALLEGEDLY UNCOORDINATED IN CALIFORNIA

Still with enforcement news, the FCC has notified Dean K. Perrins, N6HWI, of Freemont California that his alleged uncoordinated repeater on 443.725 MHz is causing interference to the coordinated K6TWI system. This is a repeater which operates on the same frequency.

The FCC says that it has information that Perrins has been notified several times
regarding the interference problem but that he has not taken any steps to resolve the problem. Perrins was given twenty days from the date of

notification to respond to the FCC. (FCC)

**

ENFORCEMENT: FCC - ALLEGEDLY UNCOORDINATED IN FLORIDA

In still another repeater interference case Joseph Bushel Jr., W2DWR, of Live Oak Florida has been directed by the FCC to respond to a complaint that he is operating a repeater on 146.94 MHz after being denied coordination by the Florida Repeater Council. The FCC says that Bushel's repeater is causing interference to the coordinated K4EHM system and the government wants him to explain his actions. The FCC also wants W2DWR to respond to an allegation that he was observed transmitting a digital voice recording an that frequency without ever identifying the transmission. (FCC)

**

ENFORCEMENT: FCC- DON'T TALK ON THAT REPEATER

Meanwhile, another Florida ham identified as Thomas Banks, KB4AN of Port Saint Lucie Florida has been notified by the FCC that he is to refrain from using an area repeater. Specifically, the FCC has told Banks that he is not to be heard over the Saint Lucie Repeater Association's AF4CN machine as requested by the system's trustee. (FCC)

**

AWARDS: ARRL EDUCATOR AWARDS NOMINATIONS SOON CLOSE

According to the American Radio Relay League, nominations close January 31st for League awards that recognize excellence in teaching. The ARRL Instructor of the Year, Educator of the Year and Professional Instructor of the Year awards will be presented, as well as the ARRL Excellence in Recruiting Award. All winners receive engraved plaques. Complete information and nomination forms are available at www.arrl.org. (ARRL)

**

AWARDS: DARA NOMINATIONS TO CLOSE

The nominating period for the 2002 Dayton Hamvention Awards is quickly coming to an end. The deadline for nominations is also January 31st.

There are three awards presented each year. They are the Radio Amateur of the Year, Special Achievement, and Technical Excellence. All amateurs Novice through Extra are eligible.

Awards are decided by the Awards Committee, based partially upon the information received. Magazine articles, newsletters, newspaper clippings, videos and the like are appreciated but cannot be returned.

Nominations can be sent to Post Office Box 964, Dayton Ohio 45401. They can also be filed electronically by completing the e-form on the web at www.hamvention.org. (DARA)

**

BREAK 2

(5 sec pause here)

**

AWARDS: NEWSLINE NAMES FOUR AS SUPER SUPPORTERS

The Amateur Radio Newsline has named four hams who will receive its first Super Supporter Award certificates. Don Wilbanks, KC5MFA, has the names:

--

In alphabetic order, the first certificate goes to Roy Blanchard, N5YHS, right here in New Orleans. It was Blanchard whose assistance made it possible for Amateur Radio Newsline to become a federally tax exempt coropration.

The second is earmarked to Dale Cary, WD0AKO for his decade plus work in putting the Amateur Radio Newsline on the Internet and creating the Amateur Radio Newsline website.

Sandy Donahue, W4RU, receives a Super Supporter certificate for his many years of coordinating the arrival of the Newsline Young Ham of the Year Award in Huntsville Alabama, and the recipients registration at Spacecamp. And for the last several years he has also helped to defray the cost of the mini-banquet held to honor the winners.

Last but by no means least, Todd Hitzeroth, N6ZXJ, was recognized for his years of volunteering with Newsline at its Dayton Hamvention booth and engineering the Ham Radio Town Meetings. What makes his contribution unique is that Hitzeroth lives in California and pays his own way to and from Dayton each year.

With congratulations to all four recipients, I’m Don Wilbanks, KC5MFA.

--

Approval for the creation of the Amateur Radio Newsline Super Supporter certificates and naming of the first four recipients took place at the organizations Board of Directors Meeting held in Glendale California on December 30th 2001. A synopsis of the minutes of that meeting will be posted to our website within the next few weeks. (ARNewsline(tm))

**

INTERNATIONAL-ISRAEL: “FIRST” BRINGS IN NEW HAMS

A new group of radio amateurs has emerged in Israel from a rather unexpected place. According to Hagal International, the new Israeli hams are from an all volunteer Search and Rescue group called First.

First members are on call to provide wilderness rescues in areas such as the Israeli desert and canyons. For communications, First members have long carried two-way hand helds operating in point to point simplex mode. The limitations of simplex in rugged terrain means that there are times when they cannot keep in touch.

Recognizing a need for improved communications, First contacted to Israel Amateur Radio Club to ask if the nationwide repeater system could be made available for search and rescue use. And according to veteran ham radio instructor Moshe Inger, 4Z4PF, when First members learned that they would first have to pass an Israeli ham radio exam, they did not flinch one bit. They studied, passed the test and there are now dozen new hams from Eilat in the South to Golan in the North. (Hagal International)

**

INTERNATIONAL-UK: G3YJO BECOMES SIR MARTIN SWEETING

Meantime, over in the United Kingdom word that Martin Sweeting, G3YJO, on being knighted. Sweeting is the Chief Executive of Surrey Satellite Technology and Director of the Surrey Space Centre. He will join Sir Jimmy Young and Sir Ben Kingsley to collect his Knights Bachelor medal from the Royal Palace. Professor Sir Martin Sweeting, F.R.S., was knighted for his services to the U-K in microsatellite engineering. (RSGB)

**

HAM RADIO IN SPACE: QUIET HOURS FOR AO-40

AMSAT reports that AO-40 satellite ground controllers have begun adjusting the spacecraft's attitude as it enters a period of adverse sun angles. The satellite is currently in a long period during which Earth eclipses the sun near perigee. These periods will continue well into next June. As a result, AO-40's operating schedule has been modified to reflect the decreasing attitude longitude. (AMSAT)

**

HAPPY BIRTHDAY: JOHANNES KEPLER AT AGE 470

VK2KGM notes the 470th recorded birthday of Johannes Kepler last December. Kepler was the first astronomer to determine a mathematical relationship existed that could be used to predict the motion of planets. This became the basis for the Keplerian data we use today for satellite orbits. (AMSAT)

**

DX

In DX, word that F2JD is active from the Philippines as DU1 slash G0SHN on 20, 15 and 10 meters SSB and CW. Listen for him from now until June of this year. QSL as directed on the air. (RSGB)

Three Finnish operators will be active from Tonga through the 15th of January, with an emphasis on 160 to 30 meters. They will work CW, SSB and RTTY with three stations using verticals and dipoles. (Modern DX)

**

THAT FINAL ITEM: FANTASTIC VOYAGE REDUX

And finally this week, the world of medical communications research has finally caught up with the lights of Hollywood. This, as the government approves a tiny radio camera-in-a-capsule that patients can swallow. It is a camera that will transmit pictures to give doctors a close-up view of what is inside of you. Amateur Radio Newsline’s Mert Garlick, N6AWE, has more:

--

The new transmitting video pill is made by Given Imaging Ltd. in Israel. It is called the M2A Swallowable Imaging Capsule. It is also exceeding tiny. In fact it is so small that it is easily swallowed by the patient.

Its inventors say that it then painlessly winds its way through the digestive tract and uses wireless technology to transmit full color pictures to a belt pack receiver worn by the patient. That unit also decodes the signal and records the information as the patient goes about his or her daily routine.

A U.S. spokesman for Given Imaging says that doctors who wish to use the video imaging pill will have to buy a specialized $20,000 computer workstation. Each camera capsule costs about $450.

For the Amateur Radio Newsline, I’m Mert Garlick, N6AWE, in Los Angeles.
Roy.

--

The entire system is reminiscent of the science fiction movie "Fantastic Voyage." In that film a submarine and its crew of medical specialists are miniaturized and injected into the bloodstream of a critically injured man to perform an operation to save his life while receiving instructions by two way radio. (Science Today)

**

You certainly can. Fancy (and expensive) antennas aren't very good and don't have any secrets in them, regardless of advertising hype.

A good antenna has to be large and installed in a clear, high place. No shortcuts work.

Hi,

i'm looking for (best) ONE program to do most of the amateur modes.
    PSK, HELL, CW, RTTY, AMTOR, PACTOR... (any other)
Mostly i would like to have TEXT transfer, but sstv/fax etc... is also good ato have.

The best thing is to have one programm running under dos. OK windows is ok also.

Hm the hardware. Best it should use the soundcard. But it is great if there
are other
hw to use (hamcom..., ptc...)

Tnx. Jochen (DH1JC)

I downloaded it from MFJ's website. Took a while on my old slow PC and
one needs Adobe Acrobat but it works fine. It's big so I put it on a
floppy disk and printed only the parts I needed.

Ham Radio University 2002/ARRL New York City-Long Island Section Convention

Ham Radio University 2002 for Long Island

North Babylon, New York - On Sunday, January 20, 2002 at 8AM, the doors of the Babylon Town Hall Annex on Phelps Lane will open for the third annual Ham Radio University. Ham Radio University 2002 is a day of education about Amateur Radio.

This year the forums have been expanded and new forums have been added. There will be twenty, one-hour presentations with special forums geared to the non-ham as well as the experienced ham radio operator. The focus will be "hands on" with many demonstrations.

Come join us at the Babylon Town Hall Annex, Phelps Lane, North Babylon, Long Island, and learn about everything from satellite communications, low power operating using radios as small as a tuna tin, how to put up an emergency antenna, the latest information on advanced digital communications, finding and fixing radio frequency interference problems to purchasing your first station equipment or handi-talkie and a special "Ask the Experts" forum. There will also be a Special Event Station W2V set up and operational on HF. There will live SSTV pictures uploaded to the NLI WWW during the event.

HRU 2002 is sponsored by the Great South Bay ARC and is a cooperative effort between over twenty clubs and organizations in the New York City- Long Island area. It is also the American Radio Relay League, New York City-Long Island Section Convention. Besides the forums, there will be tables set up with information about the different groups, ham radio classes, exam session schedules, public service and other activities.

Join us for a day of fun and education for the whole family!
Admission is open to all - donation is $2 per person.
(complimentary refreshments available)

For more information contact:
Phil Lewis N2MUN, Chairman, n2mun@arrl.net or call 631-226-0698
George Tranos N2GA, ARRL NLI Section Manager, n2ga@arrl.org or call 631-286-7562

Hi all thanks for reading this msg.

Is there an equivalent of BPQ node software for Linux that you would run with something like FBB or NNA. Maybe even BPQ work with Linux?

Thanks in advance

Nigel

FBB runs on Linux without BPQ.   BPQ's "AX.25 over Ethernet" is supported
on Linux should you want to interconnect DOS and Linux systems.

Check out TNOS, I think it has NET/ROM support.

There is at least one other Linux system not far from
here that has node software running, but it seems to
have lost it's radio port about 8 months ago, so I can
no longer verify which software it runs.

I have used both the Kiwa and the Terk extensively. The Kiwa is not worth the money. The terk is as good as it gets, unless you roll your own---but make it big.

Hi guys.

just to say that I constantly update the software pages on my site, and
carry most software's for PSK,RTTY,SSTV,MFSK,HELL etc.

Bookmark it for future use

http://www.g3vfp.com/download.html

Cheers, and have a great Christmas guys.

Dave G3VFP

I have looked at this software a couple of times.....and cannot figure out
what it does.  It appears that you are using it so.....

I thought that all it does is display a graph that will show when you are
properly tuned to the mode you want to recieve.

Does it decode and then display some of the modes that it will tune for.

I would like to find an inexpensive way to decode weather satellite
transmissions from the NOAA's of this world.  Maybe you are doing this and
know of some software that I could sue.

Bill

I have a vey high profile/power APRS station here ic Columbus Ohio. It
runs unattended, but has a modem hooked to it so I can run terminal
mode from any computer.

It has firmware 7.0 in it with "DIGI ON", thus, causing a lot of
un-needed QRM by re-transmitting "WIDE" and "RELAY" packets.

I know have the 8.2 version...any recommendations/advice on some of
the new parameters?

Thanks, & 73.

AMATEUR RADIO NEWSLINE(tm) REPORT #1270 - DEC 14th, 2001

Amateur Radio Newsline report number 1270 with a release date of Friday,
December 14th, 2001 to follow in 5-4-3-2-1.

The following is a Q-S-T.   are first on this weeks Amateur Radio Newsline report number 1270 coming your way right now. Who will be the next space tourist and will he operate from the I-S-S? This story is first on Amateur Radio Newsline report number 1270 coming your way right now!

(Billboard Cart Here)

**

HAM RADIO IN SPACE: ANOTHER TOURIST TO THE ISS

Could there be another ham radio space tourist headed to the International Space Station? Well the ham radio part is not yet known, but NASA and its partners in the I-S-S have agreed in principle to let a 28-year-old South African become the second paying tourist on the orbiting outpost. Amateur Radio Newsline's Roy Neal, K6DUE, has more:

--

The International Space Station may get its second paying customer next April. South African businessman Mark Shuttleworth has signed a contract with the Russian Aviation and Space Agency to buy a seat.

Kirsten Larson, a spokeswoman for NASA, has confirmed tentative agreement with the various space agencies that would allow him to fly. Shuttleworth is to go up to the I-S-S on a Russian built Soyuz. The arrangement was negotiated by Space Adventures, an American company in Arlington, Virginia. That's the same outfit who made the arrangements for Dennis Tito, the first space tourist. Tito, KG6FZX, was allowed to get on the ARISS radio while he was up there and created quite a stir on 2 meters.

Mark Shuttleworth is not licensed at this writing but has said that he plans to be more than just a tourist looking back at earth. He has said he will take part in a number of scientific experiments. It's not too far fetched to suggest that he may be talked into taking the time to get a ham license, time permitting, as he trains for the flight. He will have to train extensively to meet rigid standards before getting final approval. If all those ifs go together, next year ham radio may have its second tourist in space to talk to and about.

For the Amateur Radio Newsline, this is Roy Neal, K6DUE

--

Ironically, the proposed date of Shuttleworth's visit to the I-S-S would be almost exactly a year after Dennis Tito made his visit. That flight last April raised objections at the National Aeronautics and Space Administration about his fitness and training. No such problems this time around. (ARNewsline(tm) from various sources)

**

HAM RADIO IN SPACE: ISS CELEBRATES MARCONI

The International Space Station's returning skipper marked the 100th anniversary of the first trans-Atlantic wireless contact by chatting with youngsters at the exact spot history was made. The contact took place on Wednesday, December 12 th as the station, docked with the shuttle Endeavour soared over the North Atlantic, off the Newfoundland coast.

During the short QSO, outgoing station Commander Frank Culbertson, KD5OPQ, used two meter F-M to speak to teen-agers gathered at the Signal Hill National Historic Site of Canada in St. John's, Newfoundland. Culbertson managed to answer 10 questions from the students before the I-S-S flew out of range.

One of the questions asked of Culbertson was how he bathes and brushes his teeth in orbit. Another was how he gets along with his crewmates in such close quarters, and whether he misses home.

His answers? KD5OPQ told the youngsters that uses damp cloths and no-rinse shampoo, that he swallows the toothpaste since there's no sink, that he gets along fine with his colleagues, and sometimes does wished he were home.

The contact was facilitated by ARISS – Amateur Radio on the International Space station as part of an educational program at Signal Hill celebrating Guglielmo Marconi's success in receiving a wireless signal. That transmission came from Cornwall, England, on December 12, 1901 and consisted of nothing more than three dots. That’s the letter S transmitted in Morse code.

For the Amateur Radio Newsline, I’m Mert Garlick, N6AWE. Jim. (AMSAT-BB, AJ9N and ARNewsline(tm) from published news reports)

**

HAM RAIO IN SPACE: NEW HAMSAT IN 2002

Look for a new ham radio satellite to be launched in 2002. The new bird called Kolibir-2000 is a Russian and Australian School joint scientific and research microsatellite.

Miles Mann, WF1F, of MAREX reports that the new bird will be taken to orbit during a Russian a cargo mission to International Space Station. Kolibir-2000 will then stay in space attached to a remote port before being launched. (AMSAT-BB)

**

ENFORCEMENT: FCC SAYS IT WILL NOT INTERVENE IN ALABAMA NETMESS

The FCC's Enforcement Bureau has in refused to take sides in a dispute between several nets wanting to use essentially the same frequencies on the 75-meter band. The bickering had pitted the Alabama SKYWARN Net , the Alabama Traffic Net, the and the Country Cousins Net against a newly formed informal gathering of hams in another loose knit network.

The Alabama SKYWARN Net, the Alabama Traffic Net, the and the Country Cousins

Net have long operated between 3.965 and 3.970 MHz. The informal group decided to try to use the same spectrum. That's when the dispute erupted and everyone wrote to the FCC. After reading the complaints, Special Counsel for Amateur Radio Riley Hollingsworth told all four that it was really up to them to solve the problem, and to do it without breaking any rules:

--
Hollingsworth: "We issued a letter to all parties in a 75 meter interference dispute and we warned all parties and [also] attempted to explain what incidents were enforcement problems and what activities were just poor Amateur practice and degrading the entire service."
--

Hollingsworth's response went to Henry Willmon, WA4GQS, Sal Viglione, W4SAL, Jeremy Jackson, K9CNI, and Alabama ARRL Section Manager Bill Cleveland, KR4TZ. (FCC, RAIN)

**

ENFORCEMENT: FCC WARNS UNCOORDINATED REPEATER OWNER AND HIS USERS

The FCC has again written the operator of an uncoordinated Southern California repeater about ongoing interference. Again the FCC's Riley Hollingsworth:

--
Hollingsworth: "We issued a second and final warning to a Los Angeles California licensee; Angos Winke, KC6OKA, about operating an uncoordinated repeater that is interfering with the coordinated repeater W6IER. {This is] a repeater operated by the Inland Amateur Radio Club.
That licensee will also be receiving a letter from the Los Angeles office prohibiting him from using Automatic Remote Control for the repeater."
--

That means the system can only be on the air when there is a control operator present and that ham will be held responsible for any interference caused by the repeaters transmitter.

But that's not all. The FCC has also sent letters to several users of the uncoordinated repeater a warning of their own:

--
Hollingsworth: "We sent warning notices to five licensees in the Southern California area concerning operation on the coordinated repeater I mentioned a moment ago: The one that is causing interference to W6IER. This is in addition to the action mentioned about taking the licensee off of Automatic Remote Control. And we warned them about interference to the coordinated repeater."
--

Each of the letters says essentially the same thing. That the FCC has information indicating that interference to the repeater has been occurring from each of the users stations through a repeater on the same frequency as

W6IER, but one that uses various call signs. It warns the users that continued interference to the W6IER repeater could result in a monetary forfeiture of up to $7,500. Also, depending upon the evidence, revocation and suspension issues might also be warranted. (FCC, RAIN)

FCC: FCC LIBRARY CLOSED TO THE PUBLIC

Effective December 5 th and until further notice, the FCC Library is closed to the public. This action is said to be necessary because the Commission is using a portion of the library to temporarily house FCC employees. More information is on the web at http://hraunfoss.fcc.gov/edocs_public/attachmatch/DOC-218204A1.doc (CGC Communicator, FCC)

RADIO DISASTER: MISSOURI TOWER FALLS

A 1,627-foot broadcast tower near Springfield, Missouri toppled to the ground Friday morning November 30th from the weight of a foot of ice from several days of freezing rain. According to a report from KYTV the 33-year-old tower collapsed on itself like an accordion.

No one was around and the damage was confined to the area around the transmitter building at the base of the tower. No engineers were in the transmitter building when the accident occurred.

KDEB television and KTXR-FM were the resident broadcasters on the tower which was owned by American Tower of Boston. The total height included the 1,560-foot tower plus the antenna on top of it. The loss could cost American Tower or KDEB millions of dollars. (Listener reports)

HAM RADIO HELP: THANKSGIVING BASKETS

On a much happier note, a group of Indiana hams make the news this week for their generosity. Amateur News Weekly’s Jack Parker, W8ISH, tells us that the radio amateurs recently brought some holiday cheer to those who might not otherwise be able to celebrate:

--
Thanksgiving came early for many residents of Hamilton County. A half dozen Hamilton County Amateur Radio operators helped to deliver over 200 Thanksgiving food baskets to shut-in residents across the county.

This is an annual project headed up by John Wadsworth AA9KB. The food baskets are arranged by the local chapter of the American Red Cross.

Reporting for Amateur News Weekly, I'm Jack Parker, W8ISH.
--

Jack says the Hamilton County hams will be back again next year. (ANW)

HAMVENTION 2002: FORUMS SCHEDULE ANNOUNCED

If you are thinking about attending the 2002 Dayton Hamvention, then go its website and click on the Forums area. Forums Chairman Jim Ebner, N8JE, says that the initial schedule for next May's Dayton Hamvention group discussion sessions is now on line and Amateur Radio Newsline's Don Wilbanks, KC5MFA, takes a peak:

--

As previously announced, the theme of the 2002 Hamvention is Emergency Communications. In keeping with the theme, some of the highlights include Gordon West WB6NOA explaining how use of the Global Positioning System. Gordo will also show how it offers hams the ability to know where they are and describe where they are to better than a foot. That's very important information to have on hand when working an emergency situation.

But that's not all. Also on hand will be John Mc Hugh, KU4GY, the Coordinator for Amateur Radio National Hurricane Center, W4EHW. Mc Hugh will show the volunteer public service work of the gang at W4EHW, and the inside workings of the National Hurricane Center in Miami.

KU4GY will also detail two exciting projects called CARMEN and CWOP that they are working on in conjunction with NOAA. What are they? You will have to attend his session at Hamvention 2002 to find out.

Vermont's Mitch Stern, W1SJ, will also be there to talk on techniques used by the best operators involved in emergency communications. This session will also include information on the proper way to communicate during emergencies. Also hosting a session will be Mid-Cars on the importance of mobile to mobile and mobile to base communications are during emergency times.

Amateur Radio Newsline will also be there once again hosting the Live Town Hall Meeting. Bill Pasternak, WA6ITF, will moderate a session on Ham Radio Emergency Communications in the 21st Century titled Looking to Apply What We Have Learned From the Past.

And also look for the most popular sessions including Carole Perry’s Youth Forum and Joe Eisenberg, K0NEB, with the latest in kits and how to build them.

This and a lot more happens May 17th 18th and 19th at the HARA Arena in Dayton Ohio. We will see you there.

For the Amateur Radio Newsline, I’m Don Wilbanks, KC5MFA.

AMERICA AT WAR: RELIEF FUND GROWS FOR WTC VICTIM'S FAMILIES

A relief fund, established to benefit the families of the six broadcast engineers and technicians lost in the collapse of the September 11th World Trade Center has begun providing aid to the families of those killed in the terrorist attack. Amateur Radio Newsline’s Bill Pasternak, WA6ITF, has the details:

--

The Portland Oregon S-B-E electronic newsletter says that soon after its inception the S-B-E sponsored fund began drawing the attention of individuals and companies from across the country. And as of November 1st, almost $50,000 had been raised to assist their families of those who lost their lives in the collapse of the World Trade Center.

The fund that was started by the Society of Broadcast Engineers and the Ennes Educational Foundation Trust. Initial checks to the nearest family member of all six men were sent by October 31st. Eventually every penny off the money raised will go to the families of the victims. This is because the fund is all volunteer. There is no overhead of any kind involved and there is also no restriction on how the recipient may use the money.

In Los Angeles, I’m Biill Pasternak, WA6ITF, reporting for the Amateur Radio Newsline.

--

If you are interested in contributing, checks should be made payable to the Ennes Educational Foundation Trust and mailed to the Society of Broadcast Engineers, Inc., 9247 N. Meridian Street, Suite 305, Indianapolis, Indiana 46260. Mark your check to the attention of the Relief Fund. (Portland SBE)

TECHNOLOGY HONORS: FIRST ROTARY SPEED DIALER TO SMITHSONIAN

The developer of the first speed-dialer for rotary phones has finally been honored forty years after developing the unit. Pennsylvania inventor Vincent Iannucci spent two years developing the world's first speed dialer for rotary phones. The motorized device stored numbers and could dial up ten digits with the push of a button. It was nearly ready for the market in 1961, but production was disconnected by Bell Telephone Lab's after the development of touch-tone phones.

Iannucci put the prototype on his desk and used it until his own company changed over to the tone dialing system.   He was going to throw it away recently, but a relative suggested he offer it to the Smithsonian. Now it's joining the museum's collection of electro-mechanical devices. (Science Online)

ELECTRONIC SAFETY: LIGHTING RECALL

A South Carolina lighting company has recalled over 10,000 fluorescent lights because they are improperly wired and pose a fire hazard. Progress Lighting, of Spartanburg, has received two reports of the fluorescent lights smoking and smoldering, according to the Consumer Product Safety Commission. No injuries have been reported.

The recalled fluorescent ceiling and bathroom lights were sold in various shapes. The label on the light contains the manufacture's name, the manufacture date, and a catalog number. Consumers are advised to using the recalled lights immediately and contact Progress Lighting. The company can be reached at area code 866-696-8593 between 8 a.m. and 5 p.m. EST Monday through Friday. More information is on the web at: www.cpsc.gov/cpscpub/prerel/prhtml02/02036.html (Press release)

HAM RADIO IN SPACE: AMSAT ON-LINE SURVEY

AMSAT-NA has developed a new on-line volunteer survey, designed to identify the interests and skills of those who may be available to directly help in efforts to develop the amateur satellite program. The survey was developed by a committee led by AMSAT North America Vice-President and Government Liaison Perry Klein, W-3-P-K and is designed to be completed and returned on-line and takes only a few minutes to fill out. To request the survey, simply send a e-mail request to volunteer@amsat.org (AMSAT-NA)
